# Executive Summary

## Executive Summary

The purpose of the Solvency and Financial Condition Report ("SFCR") is to provide information about the capital position at 31 December 2016 of Aviva Annuity UK Limited ("the Company") based on Solvency II requirements.

The report sets out different aspects of the Company's business and performance, system of governance, risk profile, valuation methods used for solvency purposes and its capital management practices.

## Business and Performance

The Company is a limited company incorporated and domiciled in the United Kingdom ("UK") which transacts life insurance business, principally annuities. The Company predominantly carries out its business in the UK.

The Company reports to its chief operating decision makers using a non-GAAP financial performance measure referred to as 'operating profit', as defined in section A.2 of this report. The Company regards operating profit as an appropriate measure of underwriting performance. Operating loss for the Company in 2016 was £1,432 million, reflecting increasing sales of individual annuities and gains on investment assets, more than offset by the impact of Quota Share reinsurance to the parent company, Aviva Life & Pensions UK Limited ("UKLAP") and to a fellow Group company, Aviva International Insurance Limited ("All"). Under the Quota Share reinsurance arrangements, 22.5% of the Company's Long Term fund is reinsured to UKLAP and 50% of the Company's Long Term fund is reinsured to All.

Section A of this report sets out further details about the Company's business structure, key operations, market position and financial performance over the reporting period, split by underwriting performance and investment performance.

## System of Governance

The Board's responsibility includes ensuring that an appropriate system of governance is in place throughout the Company. To discharge this responsibility, the Board has established frameworks for risk management and internal control using a 'three lines of defence' model and reserves to itself the setting of the Company's risk appetite. A strong system of governance throughout the Company aids effective decision-making and supports the achievement of the Company's objectives for the benefit of customers, shareholders and regulators.

Section B of this report describes the system of governance in place throughout the Company by which the operations of the Company are overseen, directed, managed and controlled, and explains how it complies with the requirements of Solvency II. It describes the following key features:

- The roles and responsibilities of the Board, its sub-committees and key management committees, and delegation of authority to senior management;
- The remuneration policy, skills requirements and procedures for assessing fitness and propriety for senior management and key function holders;
- The Company's Risk Management Framework ("RMF") and its codification through risk policies and business standards, which set out the risk strategy, appetite and framework and minimum requirements for the Company's operations. This includes the Company's approach to its Own Risk and Solvency Assessment ("ORSA") and governance over its internal capital model for Solvency II;
- How the Company's business standards set out mandated control objectives and controls that mitigate operational risks faced by the Company, collectively providing the Company's framework of internal control;
- The role and responsibilities of the four key control functions – Risk Management, Actuarial, Compliance and Internal Audit – and how they are implemented within the Company;
- The Company's outsourcing policy and information on important outsourced operational functions.

## **Risk Profile**

As a long-term insurer, the Company accepts the risks inherent to its core business line of life insurance. Risks are diversified through the Company's scale, geographic spread, the variety of the products and services offered and the channels through which they are sold.

The Company receives premiums which are invested in order to maximise risk-adjusted returns, so that the Company can fulfil its promises to customers while providing a return to its shareholders. In doing so, the Company has a preference for retaining those risks which it believes it is capable of managing to generate a return.

The types of risk to which the Company is exposed have not changed significantly over the year and remain credit, market, underwriting, liquidity and operational risks.

Section C of this report further describes the risks to which the Company is exposed and how it measures, monitors, manages and mitigates these risks, including any changes in the year to the Company's risk exposures and specific risk mitigation actions taken.

## **Valuation for Solvency Purposes**

Assets, technical provisions and other liabilities are valued in the Company's Solvency II Balance Sheet according to the Solvency II regulations. Assets and liabilities are valued at an amount for which they could be exchanged, transferred or settled by knowledgeable and willing third parties in an arms length transaction.

The value of technical provisions under Solvency II is equal to the sum of a best estimate liability and a risk margin. Under Solvency II, the Company applies the transitional deduction to technical provisions. The transitional deduction has been approved by the Prudential Regulation Authority ("PRA").

The Company also applies a matching adjustment ("MA") to its MA portfolio. The MA is an increase applied to the risk-free rate used to value annuity liabilities where the cash flows are relatively fixed (e.g. no future premiums or surrender risk) and are well matched to assets that are intended to be held to maturity and have cash flows that are also relatively fixed.

At 31 December 2016, the Company's excess of assets over liabilities was £2,108 million on a Solvency II basis which is £356 million higher than the value under International Financial Reporting Standards ("IFRS"). The difference is primarily driven by the value of technical provisions.

Section D of this report provides further description of the bases, methods and main assumptions used in the valuation of assets, technical provisions and other liabilities for each material asset/liability class. In addition, it also provides an explanation of the material differences between the IFRS and Solvency II bases of valuation.

## **Capital management**

The Company manages Own Funds in conjunction with solvency capital requirements. In the calculation of the Solvency Capital Requirement ("SCR"), the Company has chosen to implement an Internal Model to calculate solvency capital requirements.

In managing capital, the Company seeks to on a consistent basis:

- Match the profile of its assets and liabilities, taking into account the risks inherent in the business;
- Maintain sufficient, but not excessive, financial strength in accordance with risk appetite, to support new business growth and satisfy the requirements of the Company's regulators and other stakeholders giving the Company's customers assurance of its financial strength;
- Retain financial flexibility by maintaining strong liquidity;
- Allocate capital rigorously to support value adding growth and repatriate excess capital where appropriate.

At 31 December 2016, the total eligible Own Funds to meet the SCR was £2,314 million, of which £2,108 million was represented by unrestricted tier 1 capital. The Company's SCR, which is calculated using an Internal Model, at 31 December 2016 was £1,126 million. The overall surplus position was £1,188 million which translates to a regulatory cover ratio of 206%.

Section E of this report further describes the objectives, policies and procedures employed by the Company for managing its Own Funds. The section also covers information on structure and quality of Own Funds and calculation of SCR, including information about the Company's Internal Model.

# Section A

## Business and Performance

### In this chapter

A.1 Business

A.2 Underwriting Performance

A.3 Investment Performance

A.4 Performance of other activities

A.5 Any other information

## Section A: Business and Performance

The 'Business and Performance' section of the report sets out the Company's business structure, key operations and financial performance over the reporting period.

### A.1 Business

#### A.1.1 Business overview

The Company, a limited company incorporated and domiciled in the UK, transacts life assurance business, principally annuities. The Company predominantly carries out its business in the UK.

#### A.1.2 Organisational structure

The following chart shows, in simplified form, the position of the Company within the legal organisational structure of the Aviva plc Group ("the Group") as at 31 December 2016. Aviva plc is the holding company of the Group and is the ultimate parent undertaking of the Company. The immediate parent undertaking of the Company is Aviva Life & Pensions UK Limited, a company incorporated in the UK.

The Company has a fully owned material related undertaking, Aviva ERFA UK 15 Limited, a company incorporated in the United Kingdom. A full list of the related undertakings of the Company is shown in Appendix F.3.

Refer to section B for a detailed description of the system of governance in place within the Company and the Group.

#### A.1.3 Significant events in the reporting period

On 1 January 2016, the Company securitised £4,179 million of equity release mortgages by transferring them to a wholly owned subsidiary, Aviva ERFA 15 UK Ltd. In return, the Company received £4,154 million of loan notes issued by its subsidiary.

On the same date, the Company increased the proportion of Quota Share reinsurance with a fellow group subsidiary, All, from 10% to 50%.

On 30<sup>th</sup> September 2016 the Company securitised a further £435 million of equity release mortgages by transferring them to Aviva ERFA 15 UK Ltd. In return, the Company received £433 million of loan notes issued by its subsidiary.

On 9 November 2016 the Boards of the Company and UKLAP approved the Scheme to transfer the insurance business of the Company into UKLAP, under a Part VII Transfer of the Financial Services and Markets Act 2000. The UK Court approved the scheme on 6 December 2016, with the transfer effected on 1 January 2017.

#### **A.1.4 Other information**

##### **Qualifying holdings**

Qualifying holdings in the Company are held by Aviva Life & Pensions UK Limited ("UKLAP"), a limited company incorporated and domiciled in the UK, which holds 100% of the Company's share capital.

##### **Supervisor**

The Group's and Company's Supervisor is the PRA, which is part of the Bank of England. Contact details for the PRA are as follows:

Address 20 Moorgate, London, EC2R 6DA.

Telephone number +44 (0) 20 7601 4444

##### **External auditor**

The Company's external auditor is PricewaterhouseCoopers LLP. Contact details are as follows:

Address Central Square, 29 Wellington Street, Leeds, LS1 4DL.

Telephone number +44 (0) 113 289 4000

## **A.2 Underwriting Performance**

### **Operating profit – measurement of performance from underwriting and other activities**

The Group reports to its chief operating decision makers using a financial performance measure referred to as 'operating profit'. The Group and the Company regard operating profit as an appropriate measure of underwriting performance.

Operating profit is defined across the Group as IFRS profit before income taxes, excluding the following items: investment return variances and economic assumption changes on long-term business, impairment of goodwill, associates, and joint ventures and other amounts expensed, amortisation and impairment of acquired value of in-force business, amortisation and impairment of other intangibles, profit or loss on the disposal and remeasurement of subsidiaries, joint ventures and associates, integration and restructuring costs and other items.

Section A.2.1 shows a reconciliation of the operating profit to the income statement included in the Company's financial statements.

While these excluded items are significant components in understanding and assessing the Company's financial performance, presentation of operating profit enhances the understanding and comparability of the underlying performance of the business by highlighting net income attributable to ongoing operations.

### A.2.1 Performance from underwriting and other activities

The table below presents the operating profit for the Company for the year ended 31 December 2016, as well as the reconciliation of operating profit to IFRS profit before tax as included in the Company's financial statements.

	<b>FY16 £m</b>
Gross written premiums	1,463
Premiums ceded to reinsurers	(15,763)
Net earned premiums	(14,300)
Net investment income	4,672
Other income	187
<b>Income</b>	<b>(9,441)</b>
Claims and benefits paid, net of recoveries from reinsurers	(582)
Change in insurance liabilities, net of reinsurance	12,612
Fee and commission expense	(33)
Other expenses	(25)
Finance costs	(3,439)
<b>IFRS Profit before tax attributable to shareholders' profits</b>	<b>(908)</b>
Adjusted for non-operating items:	
Investment return variances and economic assumption changes on long-term business	(524)
<b>Operating profit before tax attributable to shareholders</b>	<b>(1,432)</b>

The Company's operating loss is primarily driven by the loss recognised on two Quota Share reinsurance arrangements:

- The Company has a Quota Share reinsurance arrangement in place with its immediate parent undertaking, UKLAP. Under the terms of the Quota Share reinsurance, 22.5% of the Long Term Fund of the Company is reinsured to UKLAP. Operating loss of £282 million has been recognised in respect of these arrangements during 2016. Further details of the impact on individual line items within the financial statements is provided in note 34 of the Company's financial statements.
- The Company also has a Quota Share reinsurance arrangement in place with a fellow Group company, All. Under the terms of this Quota Share reinsurance 50% of the Long Term Fund of the Company is reinsured to All. The reinsured proportion was increased from 10% to 50% on 1 January 2016. Operating loss of £1,917 million has been recognised in respect of these arrangements during 2016. Further details of the impact on individual line items within the financial statements is provided in note 34 of the Company's financial statements.

Items of income and expenses that do not directly relate to the Group's underwriting and investment activities are disclosed outside of operating profit. These are collectively referred to as 'adjusting items'. The adjusting items are shown in the reconciliation from profit before tax to the adjusted operating profit in the table above.

### A.2.2 Solvency II lines of business and products

Detailed information on premiums, claims, expenses and changes in technical provisions by Solvency II line of business is presented in Quantitative Reporting Templates ("QRTs") S.05.01.02 and S.05.02.01 (included in the Appendices in Section F.1). The company principally transacts annuity business. For Solvency II reporting purposes this is classed as 'Other Life Insurance' business.

## A.3 Investment performance

### A.3.1 Measurement of investment performance

Net investment income as disclosed in the Company's financial statements represents the Company's overall investment performance. Net investment income consists of dividends, interest and rents receivable for the year, realised gains and losses, and unrealised gains and losses on investments held at fair value.

Operating profit (section A.2) includes an expected investment return on financial investments with a consistent allowance for the corresponding expected movement in liabilities.

Assets are invested in order to generate a return for both policyholders and shareholders. The financial strength of the Company and both current and future operating results and financial performance are, therefore, in part dependent on the quality and performance of the investment portfolios held by the Company.

The aim is to match appropriate investments to the nature of the underlying liabilities, whilst at the same time considering regulatory requirements, the level of risk inherent within different investments, and the desire to generate superior investment returns, where compatible with the stated strategy and risk appetite.

### A.3.2 Investment performance by asset class

The following section summarises the Company's net investment income and provides an analysis of net investment income by fund type.

	Debt Securities £m	Equity Securities £m	Loans £m	Other financial investment £m	Investment property £m	Other £m	Total £m
<b>Net Investment Income - Total</b>							
Dividends	-	4	-	-	-	-	4
Interest	712	-	792	17	-	75	1,596
Net realised gains/(losses)	343	-	(19)	244	-	-	568
Net unrealised gains/(losses)	1,565	4	796	165	2	(57)	2,475
Rental income less expenses					17	-	17
Other income less management charges	-	-	-	11	-	1	12
<b>Total</b>	<b>2,620</b>	<b>8</b>	<b>1,569</b>	<b>437</b>	<b>19</b>	<b>19</b>	<b>4,672</b>

The Company's investment management fees amounted to a net credit of £9 million.

All the Company's investment return is attributable to shareholders but for assets backing long-term liabilities there is a corresponding movement in liabilities within operating profit.

Net investment income primarily consists of interest, realised and unrealised gains on debt securities on mortgage loans.

- Net gains on debt securities reflect the returns on underlying indices (Government all stock indices of 7.0% and Corporate bond indices of 6.0%). The return reflects falling yields on gilts and investment grade bonds during 2016.
- Interest on loans reflects interest received on the Company's commercial mortgage and equity release mortgage portfolios.
- Net gains on loans reflect the impact of reductions in interest rates during the year on fixed rate commercial mortgages and equity release mortgages.

Items within 'Other' primarily consist of investment income in respect of participations and other Companies within the Group.

### A.3.3 Investment performance: Other information – Investments in securitisations

Securitisation means a transaction or scheme, whereby the credit risk associated with an exposure or pool of exposures is tranching, having both of the following characteristics:

- payments in the transaction or scheme are dependent upon the performance of the exposure or pool of exposures;
- the subordination of tranches determines the distribution of losses during the ongoing life of the transaction or scheme.

The Company holds investments in securitisation vehicles that are not originated by the Company and those issued by a wholly owned subsidiary, Aviva ERFA 15 UK Limited, in the form of debt securities. These securities consist of residential mortgage backed securities, commercial mortgage backed securities, asset backed securities, asset backed commercial papers and wrapped credit securities.

Net investment income in the Company for the year in respect of these securitisations was £692 million. Net investment income on the investment in Aviva ERFA 15 UK Limited included within this total amounted to £646 million.

The key risks the Company's securitisations are exposed to are market risk and credit risk. The Company's risk management procedures in respect of market risk and credit risk are described in sections C.2.2. and C.3.2.

#### **A.4 Any other information**

The Company's operating loss for the period was £1,432 million. The adjusting items reported below operating profit are outlined below.

Operating profit for the Company is based on expected investment returns on financial investments over the period, with consistent allowance for the corresponding expected movements in liabilities. The expected rate of return is determined having regard to long term economic and market forecasts of investment return and asset classification.

Operating profit includes the effect of variances in experience for non-economic items, such as mortality, persistency and expenses, and the effect of changes in non-economic assumptions. Changes due to economic items, such as market value movement and interest rate changes which give rise to variances between actual and expected investment returns, and the impact of changes in economic assumptions on liabilities, are disclosed as non-operating items.

Net investment income, as discussed in section A.3 'Investment performance', includes both the operating and non-operating component of investment return.

Other non-operating items primarily consist of investment return variances and economic assumption changes on long-term business.

Operating profit is not a substitute for profit before income taxes or net income as determined in accordance with IFRS. The Company's definition of operating profit may differ from similar measures used by other companies, and may change over time.

# Section B

## System of Governance

### In this chapter

- B.1 General information on the system of governance
- B.2 Fit and Proper policy
- B.3 Risk management system including the ORSA
- B.4 Internal control system
- B.5 Internal Audit function
- B.6 Actuarial function
- B.7 Outsourcing

## Section B: System of governance

This section of the report sets out information regarding the 'System of Governance' in place within the Company.

Details of the structure of the Company's "administrative, management or supervisory body" (defined as including the Board, subsidiary boards and Board sub-committees) are provided. The roles, responsibilities and governance of key functions (defined as the Risk, Compliance, Internal Audit and Actuarial functions) are also provided. Other components of the system of governance are also outlined, including the risk management system and internal control system implemented across the business.

### B.1 General information on the system of governance

#### B.1.1 Overview of the Company's system of governance

##### Role and responsibilities of the Board

The Board's role is to be responsible for promoting the long-term success of the Company and for setting the strategy, against which management's performance is monitored. It sets the risk appetite and satisfies itself that financial controls and risk management systems are robust, whilst ensuring the business is adequately resourced. The Board is also responsible for setting the values and supporting the culture of the Company, and ensures appropriate dialogue with shareholders on strategy and remuneration.

The Board's responsibility includes ensuring that an appropriate system of governance is in place. To discharge this responsibility, the Board has established frameworks for risk management and internal control using a 'three lines of defence' model.

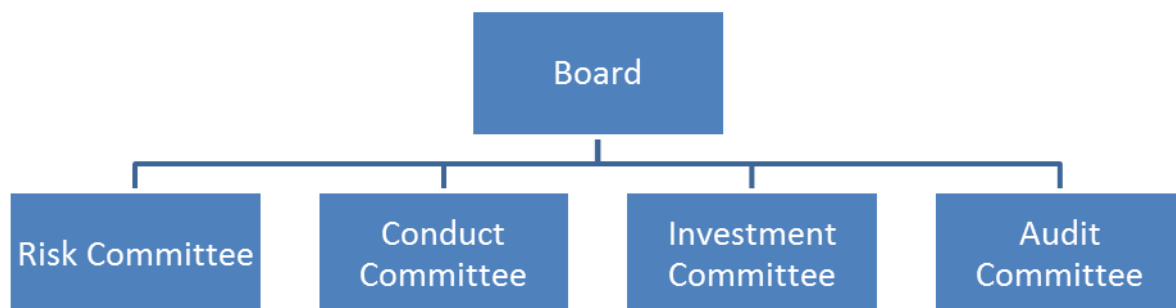

A strong system of governance aids effective decision-making and supports the achievement of business objectives for the benefit of customers, shareholders and regulators.

The Board comprises the Chairman, Chief Executive Officer, Chief Financial Officer and Independent Non-Executive Directors ("NEDs"). The Board's policy is to appoint and retain NEDs, who can apply their wider business knowledge and experiences to their oversight of the Company, and to review and refresh regularly the skills on the Board.

The Board has established and delegated responsibilities to various committees to assist in its oversight of risk management and the approach to internal controls. There is alignment and communication between these committees and there is regular reporting to the Board.

The full duties of the Board and of each of its committees are set out in each respective Terms of Reference. The Terms of Reference list both those items that are specifically reserved for decision by the Board and those matters that must be reported to the Board.

The diagram illustrates the governance structure and a brief description of the main roles and responsibilities of each committee follows:

The **Risk Committee** is responsible for assisting the Board in its oversight of risk, reviewing the Company's risk appetite and risk profile in relation to capital, liquidity and franchise, reviewing the effectiveness of the Company's RMF, reviewing the methodology used in determining the Company's capital requirements, stress testing, ensuring due diligence appraisals are carried out on strategic or significant transactions, and monitoring the Company's regulatory requirements in relation to prudential matters, as appropriate.

The **Conduct Committee** is responsible for assisting the Board in its oversight of conduct issues. This oversight includes oversight of the Company's conduct framework including product design, live selling practices, claims practices, conduct oversight of third parties, the achievement of an appropriate conduct focused culture and the management of good and influential relationships with the regulators. It also sets and reviews the conduct and financial crime risk appetites and ensures that the reputational risk is consistent with the risk preference approved by the Board.

The **Investment Committee** is responsible for assessing and approving investment strategy consistent with the risk appetite approved by the Board; considering investment matters that require Board approval (for example the investment into a new asset class); overseeing the relationship between the Company and its investment managers and monitoring investment performance.

The **Audit Committee** is responsible for monitoring the integrity of the Company's financial statements and the effectiveness of the systems of internal control and for monitoring the effectiveness, performance, independence and objectivity of the internal and external auditors.

An effective delegated authority framework is an important part of good business governance. A set of transaction categories provide a comprehensive framework for assigning financial authorities to certain individuals consistently across the Company, with limits within each category to ensure they support effective and appropriate decision making.

### **The 'three lines of defence model', and roles and responsibilities of key functions**

Roles and responsibilities for risk management are based around the 'three lines of defence model' where employees are involved in the management and mitigation of risk. The roles of the three lines of defence each contribute to embedded risk management.

#### ***The first line: management monitoring***

Management are responsible for the application of the RMF, for implementing and monitoring the operation of the system of internal control and for providing assurance to the Risk, Conduct, Investment and Audit Committees, and the Board.

#### ***The second line: Risk Management, Compliance and Actuarial functions***

The Risk Management function is accountable for developing the RMF and for the quantitative and qualitative oversight and challenge of the identify, measure, manage, monitor and report ("IMMMR") process. As the business responds to changing market conditions and customer needs, the Risk Management function regularly monitors the appropriateness of the Company's risk policies and the RMF to ensure they remain up to date.

The Actuarial function is accountable for actuarial methodology, reporting to the relevant governing body on the adequacy of reserves and capital requirements, as well as underwriting and reinsurance arrangements.

The Compliance function supports and advises the business on the identification, measurement and management of its regulatory, financial crime and conduct risks. It is also accountable for monitoring and reporting on the compliance risk profile.

Refer to sections B.3.2, B.4.2 and B.6 for further details on the roles, responsibilities, authority, resources, independence and reporting lines of the Risk Management, Compliance and Actuarial functions respectively, and how their independence is ensured.

#### ***The third line: Internal Audit***

This function provides independent and objective assessment on the robustness of the RMF and the appropriateness and effectiveness of internal control to the Audit, Conduct, Risk and Investment Committees, and the Board.

Refer to section B.5 of this report for details on the roles, responsibilities, authority, resources, independence and reporting lines of the Internal Audit Function.

### **Implementation and assessment of adequacy of the system of governance**

The Company implements its RMF and system of internal controls and associated reporting procedures consistently throughout, via group-wide risk policies and business standards. To support an assessment of the effectiveness of the governance, internal control and risk management requirements, the Chief Executive Officer is required to certify annually that:

- there are sound risk management and internal control systems that are effective and fit for purpose in place across the business; and

- material existing or emerging risks within the business have been identified and assessed and the business operates in a manner which conforms to the minimum requirements outlined in the risk policies and business standards.

Linked to this, the Chief Risk Officer must certify that:

- the Risk function has reviewed and challenged the process supporting the Chief Executive Officer's certification and is satisfied that it can provide reasonable assurance of the material accuracy and completeness of the Chief Executive Officer's assessment; and
- no material gaps exist in the RMF as it applies to the Company.

Any material risks not previously identified, control weaknesses or non-compliance with the risk policies and business standards or local delegations of authority, must be highlighted as part of this process.

### **Changes in the system of governance during 2016**

There have been no material changes in the system of governance during the year.

Terms of reference for all Board Committees were updated during 2016 and changes were approved by the Board.

#### **B.1.2 Remuneration Policy**

All staff are employed by a fellow subsidiary undertaking of Aviva plc, Aviva Employment Services Limited, who make a management charge for services, including the provision of staff to the Company. The Group's reward principles and arrangements are designed to incentivise and reward employees for achieving stated business goals in a manner that is consistent with the Company's approach to sound and effective risk management. The Group's remuneration philosophy is based on four key principles which are outlined below:

- Align to the Group's purpose and strategy;
- Incentivise achievement of the Group's annual business plan and longer term strategic objectives of the business;
- Recognise leaders who achieve the required business results through living the Group values and behaviours; and
- Ensure risk based decision making and good governance.

##### **B.1.2.1 Executive directors ("EDs")**

The group-wide Remuneration Committee considers alignment between the strategy and the remuneration of its EDs is critical. The Remuneration Policy provides market competitive remuneration, and incentivises EDs to achieve both the annual business plan and the longer-term strategic objectives of the business. Significant levels of deferral and an aggregate shareholding requirement align EDs' interests with those of shareholders and aid retention of key personnel. As well as rewarding the achievement of objectives, variable remuneration can be zero if performance thresholds are not met.

Remuneration of EDs includes a basic salary, variable components, a pension, benefits (including relocation and mobility) and a shareholding requirement.

The variable components include an annual bonus and Long Term Incentive Plan ("LTIP"). The annual bonus is based on performance in the year. Targets are set annually and pay-out levels are determined by the Remuneration Committee based on performance against those targets. A significant proportion of any bonus awarded is deferred into shares which vest after three years.

The LTIP vests subject to performance against two equally weighted performance measures, absolute return on equity ("ROE") and relative total shareholder return ("TSR") performance, which have been chosen to reflect shareholders' long-term interests. Half of the LTIP vests if ROE exceeds 30% over the three-year performance period. The other half vests if the TSR is in the upper quintile when compared to a number of other external companies over the three year period. The proportion of shares vested is lower if these performance measures are not met, and falls to zero when performance measures fall below pre-set targets.

The Group did not operate any enhanced pension arrangements or early retirement schemes for key management during the reporting period.

##### **B.1.2.2 NEDs**

NEDs receive a basic annual fee in respect of their Board duties. Further fees are paid for membership and, where appropriate, chairmanship of Board committees. The Chairman receives a fixed annual fee. Fees are reviewed annually

taking into account market data and trends and the scope of specific Board duties. The Chairman and NEDs do not participate in any incentive or performance plans or pension arrangements and do not receive an expense allowance.

### **B.1.2.3 Employees**

Remuneration arrangements for employees that are not EDs take account of the seniority and nature of the role, individual performance and local market practice. The aim is to provide employees with remuneration packages that are clear and simple to understand, transparent, consistent and fair. Remuneration includes a basic salary, variable components and a pension.

Variable payments are discretionary and fully flexible as opposed to a contractual entitlement, and there is a possibility of zero awards being made should the performance of the Group and/or individuals require this. Individual awards are based on a calibrated assessment of performance of individuals relative to peers.

The remuneration of employees in the Risk Management function (including Compliance and the Actuarial function) and Internal Audit is determined independently of the financial results of the business areas they oversee. This reinforces the independence of these functions.

### **B.1.2.4 Material transactions with shareholders and persons exercising significant influence during the period**

Key management personnel may from time to time purchase insurance, savings, asset management or annuity products marketed by Group companies on equivalent terms to all employees of the Group. Any transactions with key management personnel deemed to be significant either by size or in the context of their individual financial positions have been conducted on an arms-length basis.

Additional information on the material transactions with the Company's shareholder is included within Note 33 – 'Related party transactions' of the Company's financial statements.

## **B.2 Fit and Proper policy**

The Group has the following policies in place to ensure that individuals acting on behalf of the Company are both "fit" and "proper" in line with the PRA's Fit and Proper requirements for individuals subject to the Senior Insurance Manager Regime and the Financial Conduct Authority's requirements for Approved Persons:

- Fit - As part of recruitment and employee screening, an individual's career history will be assessed and validated to establish whether an individual's skills and knowledge are appropriately matched to the role.
- Proper – checks are in place to ensure that an individual is honest, of good reputation, has integrity and is financially sound.

The governance over the fitness and propriety of individuals spans across the employee lifecycle including recruitment, performance management and training. To ensure the Group protects itself against employing individuals who potentially could threaten its people, customers, properties, facilities or reputation, the majority of Fit and Proper activities take place within recruitment and more specifically in pre-employment screening.

To support the recruitment activity for all staff across the Group, a policy to apply a minimum set of basic screening requirements has been agreed and implemented. Additional enhanced screening requirements and ongoing Fit and Proper requirements are also applied for individuals who fall within the following categories, as required by Solvency II requirements:

- Persons running the undertaking;
- Administrative, management or supervisory body; and
- Persons responsible for key functions.

For persons responsible for running the undertaking or responsible for key functions this assessment must consider their allocated responsibilities and skills and experience across a skills matrix covering the following areas:

- Insurance and financial markets;
- Business strategy and business models;
- System of governance;
- Financial and actuarial analysis; and

- Regulatory framework and requirements.

The group-wide Nomination Committee identifies the skills and experience that it would like to have at Board level. These requirements are set out in a comprehensive skills matrix where Board members are asked via an online questionnaire to self-assess their experience and skills each year. The Skills Matrix is integral to the Committee's planning, discussions for developing further the Board's succession plans and commitment to Board diversity. Additionally, it is an essential tool to review and reflect on the skills that individual directors currently possess and ascertain areas in which training and development can be strengthened.

Prior to appointing an individual into a key function role, checks take place to ensure that the relevant skills and experience have been identified and agreed for the role. This is achieved by engaging with both internal and external subject matter experts in each specialism to define the skills and experience required for each key function role.

In all cases local business subject matter experts are engaged to ensure that all skills and experience requirements have been identified, including any specific qualifications required to carry out the role. These individual key function role skills and experience requirements and qualifications, where applicable, are captured within individual role descriptions for each role.

Compliance with the initial and ongoing Fit and Proper minimum requirements is reported as part of the People Business Standard attestation by the People Director on behalf of the Chief Executive Officer to the Group People function.

## **B.3 Risk management system including the ORSA**

### **B.3.1 Overall risk management system: strategies, processes and reporting procedures**

The RMF forms an integral part of the management and Board processes and decision-making framework across the Company. The key elements of this framework comprise risk appetite; risk governance, including risk policies and business standards; and the processes used to IMMMR risks, including the use of the Company's risk models and stress and scenario testing.

To promote a consistent and rigorous approach to risk management across all parts of the business, there is a set of risk policies and business standards which set out the risk strategy, appetite, and minimum requirements for the Company's operations. On a semi-annual basis the Chief Executive Officer and Chief Risk Officer sign-off compliance with these policies and standards, providing assurance to the relevant oversight committees that there is a consistent framework for managing the business and the associated risks.

For the purposes of risk identification and measurement, risks are usually grouped by risk type: credit, market, liquidity, underwriting and operational risk. Risks falling within these types may affect a number of metrics including those relating to balance sheet strength, liquidity and profit. They may also affect the performance of the products delivered to customers and the service to customers and distributors, which can be categorised as risks to the brand and reputation or as conduct risk.

A regular top-down risk assessment and reporting process is facilitated by the Risk Management function. This includes the consideration of emerging risks and is supported by deeper thematic reviews. This, together with the risk and control self assessment ("RCSA") process, are the main processes used to IMMMR risks. They are run separately but are complementary. The RCSA process is run by the first line, with challenge by the Risk Management function. It focuses on operational risks, which are recorded on 'iCARE', the Company's risk management system.

Risk models are an important tool in the measurement of risks and are used to support the monitoring of the risk profile and in the consideration of the risk management actions available. A range of stress tests are carried out (where one risk factor, such as equity returns, is assumed to vary) and scenario tests (where combinations of risk factors are assumed to vary) to evaluate their impact on the business and the management actions available to respond to the conditions envisaged.

The Risk Management function is accountable for quantitative and qualitative oversight and challenge of the IMMMR process and for developing the RMF. Internal Audit provides an independent assessment of the risk framework and internal control processes.

Board oversight of risk and risk management across the Company is maintained on a regular basis through the Risk, Conduct and Investment Committees.

The Board has overall responsibility for determining risk appetite, which is an expression of the risk the business is willing to take. Risk appetite is set for capital and liquidity. Economic capital risk appetites are also set for each risk type, calculated on

the basis of the Solvency II balance sheet. The position against risk appetite is monitored and reported to the Board on a regular basis.

Risk preferences, being qualitative statements that express the risks that the Company seeks to avoid or minimize, are also set by the Board. Long-term sustainability depends upon the protection of franchise value and good customer relationships. As such, there is a risk preference that the Company will not accept risks that materially impair its reputation and requires that customers are always treated with integrity.

Reporting of risks is provided to Board Committees and the Board by management, alongside Risk and Audit opinions. The Board has set clear expectations that reporting must present an accurate, clear and timely picture of existing and emerging issues, risk exposures and risk management activities and provide demonstrable evidence that the Company is managing its risks.

Under Solvency II, the Internal Model must be embedded at the heart of risk and capital evaluation and its outputs must be used as a key part of a wide range of business and strategic decisions. As well as being a Solvency II requirement, this makes sense from a business perspective – using a model which reflects the actual risk profile of the business drives more informed decisions. An annual Business Use Assessment process takes place which facilitates embedding and evidencing of the use of risk management and economic capital in decision making.

It is recognised that it is important to have an appropriate risk culture (“tone from the top”). An appropriate culture includes the effective management of exposures, adequate resourcing, effective communication, malpractice reporting, a business ethics code that is annually signed up to by employees, and a commitment to integrity, ethical behaviour and compliance.

A risk and control goal is set for senior management as part of the annual bonus plan to help drive and reward effective risk management and a robust control environment. This is assessed on an annual basis by the Group Risk Management function.

### **B.3.2 Risk management function**

The Risk Management function is responsible for the design and implementation of the risk management system, and the design and independent validation of economic capital models requiring regulatory approval. The Risk Management function reports to the board on material risks identified, together with any other specific areas of risk requested by the board, and assists the board and management in the effective operation of the risk management system through the provision of specialist analysis and quality reviews, an aggregated view of the risk profile, and an assessment of the key risks associated with the business’s strategy, major projects, strategic investments and other key decisions.

The Risk Management function has authority to review all areas of the business and has full, free and unrestricted access to all activities, records, property and personnel necessary to complete its work. The scope of Risk’s activities extends to all legal entities, joint ventures, partnerships, outsourcing and reinsurance arrangements.

The Risk Management function operates as part of the Global Risk function, which includes the Actuarial and Compliance functions as well as Risk Management. Further information on the Actuarial and Compliance functions is set out in sections B.6 and B.4.2 respectively.

### **B.3.3 Integration of risk management into the decision making processes**

Under Solvency II, the Internal Model must be embedded at the heart of risk and capital evaluation and its outputs must be used as a key part of a wide range of business and strategic decisions. As well as being a Solvency II requirement, this makes sense from a business perspective - using a model which reflects the actual risk profile of the business drives more informed decisions. An annual Business Use Assessment process takes place which facilitates embedding and evidencing of the use of risk management and economic capital in decision making.

All key decisions must have the support of the Risk Management function before proceeding and the Chief Risk Officer has the power of veto.

### **B.3.4 ORSA**

The ORSA Report is the outcome of the combined processes and procedures (collectively ORSA processes) in place to manage and assess the risk and solvency position of the Company. The goal of the ORSA is to provide a continuous and forward-looking assessment of the short-term and long-term risks that the Company faces, or may face, ensuring that solvency requirements are met at all times.

The ORSA processes comprise a number of elements of the RMF which are embedded in the business through the requirements of supporting risk policies and business standards around strategy, planning, capital management, stress and scenario testing and use of economic capital in decision making.

In combination, these elements create a holistic overview of the elements of risk that may impact the Company, and which should be taken into account by management in day-to-day decision-making, in particular through the use of economic capital, and ensures risk and capital management are connected.

The ORSA Report articulates the Board's formal view of the capital the Company need to hold, given the risks currently faced by the business and how these might evolve over time, in line with delivery of the business strategy. It summarises a high level description of the key components of the underlying ORSA processes and the key outcomes from these processes.

Consistent with the three lines of defence model, first-line management is responsible for the implementation of the majority of the underlying ORSA processes.

The output from the ORSA processes is reported to the Board and the Board Risk Committee regularly during the year. The ORSA (Supervisory) Report is produced annually, as well as an interim ORSA update following the strategy refresh. The Chief Risk Officer is responsible for producing the ORSA Report which is reviewed and approved by the Risk Committee and the Board.

The Board has approved that for the purpose of ORSA, capital resources and requirements are measured on the basis of Solvency II requirements for determining Solvency II Own Funds and SCR.

Economic capital (as a risk based capital measure) is embedded at the heart of the Company's risk and capital evaluation and is used as a key input to a wide range of business and strategic decisions. The RMF, supported by risk policies and business standards, sets out the areas where businesses are expected to use economic capital management information as part of their decision-making and risk management processes. This ensures that requirements to use economic capital are embedded within the instructions of how the relevant processes (for example asset liability management or strategy and planning) are to be performed. Economic capital is calculated using the Company's Internal Model.

### **B.3.5 Governance over the Internal Model**

The Solvency II Internal Model Governance and Data Governance business standards and associated guidance, manuals, logs and reports are part of the overall RMF. These combine to ensure that our businesses operate within a controlled environment when developing methodologies and assumptions, and when running processes and systems.

The appropriateness of the Company's Internal Model is tested and confirmed by model validation, review and challenge, weakness and limitation management and general change control processes. In aggregate, these tests ensure there is a robust governance framework to support the use of the Internal Model in both a production environment and during model development or change.

The Board is responsible for approving any Internal Model changes before submission to the College of Supervisors for approval. It is anticipated that there will be one model change application a year (around June each year). The quarterly model change reports and supporting evidence provide the required information to support Board Risk Committee and the College of Supervisors approval.

The Chief Risk Officer is the ultimate Internal Model Owner. In practice the day to day responsibilities are delegated to the Chief Risk Actuary, as he has the accountability to give assurance to the Board that the Internal Model is appropriate for use on an ongoing basis; adequately reflects the business's risk profile; takes into account new information as it becomes available and works effectively. This enables the Board to conclude whether the Internal Model is fit for purpose whilst also ensuring it is used to provide information for important strategic and business decisions; capital management; business planning; risk mitigation; investment allocation and product development.

The Internal Model Independent Validation Review (refer to the section below for further details) also provides an opinion to the Board on whether the Internal Model is suitably accurate and fit for purpose, and whether or not its approval is recommended. Since approval of the Company's Internal Model Application, work has continued to refine the model change process and update the Solvency II Model Governance Business Standard in accordance with PRA feedback. This Business Standard clarifies how changes or updates to the Internal Model should be treated to ensure appropriate documentation, validation and governance can be applied before implementation for regulatory reporting.

## Validation processes

As a key part of capital assessment and capital management, the Internal Model is rigorously validated using a series of tests. This suite of tests includes both validation of the individual calibrations and methodologies underlying the model, and validation of the model using its results.

The validation tests applied comprise both mathematically defined tests and those based on qualitative judgment, to ensure that the model and its components are both accurate and reflect management opinion. Key tests include benchmarking (the results of the Internal Model and its components are compared against external benchmarks), back-testing (historic experience is compared against the results produced by the model) and sensitivity testing (the analysis of the change in results due to changes in its inputs). The validation tests are run, documented and assessed against criteria set by the Actuarial function, and are designed to draw conclusions on the appropriateness of the Internal Model. The results of this analysis are made available to the Risk Committee and Board.

In addition, separate and independent validation of the Internal Model is performed to give assurance to the Board that the model is appropriate for use on an ongoing basis, adequately reflects the business's risk profile and takes into account new information as it becomes available, and is accurate and works effectively. This informs whether the Internal Model is fit for purpose, including informing important strategic and business decisions, capital management, business planning, risk mitigation, investment allocation and product development.

The Board approves the scope and approach proposed by the Enterprise Risk Director (who reports into the Chief Risk Officer) for each independent validation exercise, as required by the Internal Model Independent Validation Business Standard. The Enterprise Risk Director performs the independent validation and provides an opinion to the Board whether the Internal Model is materially fit for purpose.

The independent validation to support year end 2016 concluded that the Internal Model is materially compliant with Solvency II requirements and is appropriate for calculating solvency capital requirements on an ongoing basis.

## B.4 Internal Control System

### B.4.1 Description of the internal control system

Internal controls facilitate effective and efficient business operations, the development of robust and reliable internal reporting and compliance with laws and regulations.

The Internal Control Business Standard sets out required controls for effective internal control across the Group. It comprises five key principles.

- The Company sets an appropriate culture, including “tone from the top”. This ensures the effective management of exposures, adequate resourcing, effective communication, malpractice reporting, a business ethics code that is annually signed up to by employees, and a commitment to integrity, ethical behaviour and compliance.
- The Company has an organisational structure that supports the system of internal control. This includes the effective operation of an adequately resourced three lines of defence model, appropriate and proportionate segregation of duties, a clear system of delegated authorities, clearly defined roles and responsibilities for staff, and the consideration of risk management and control responsibilities when setting objectives for and reviewing the performance of all staff.
- The Company has an RMF (see section B.3.1).
- The Company has effective controls for each core business process and that these are monitored and reported upon regularly.
- The Company has a risk oversight process that provides adequate challenge to the completeness and openness of internal control and risk assessment.

### B.4.2 Compliance function

The primary purpose of the Compliance function is to assess and manage the business's exposure to regulatory risk. In the UK, where a dual regulatory system exists, this activity has been divided between prudential and conduct regulatory risk.

The Compliance function is an integral part of the RMF and constitutes a key part of corporate governance. The function is a critical contributor to the safe and sound operation of the business and underpins the achievement of strategic and business

goals. The Compliance function is lead by the Compliance Director, who reports to the Chief Risk Officer and has delegated authority to manage compliance related risk across the business.

The Compliance function is required to monitor and assess the impact of changes in the legal environment on the operations of the business. Given the highly specialised nature of the work, the Legal function is responsible for this activity. The Compliance Function, with support from the legal function is required to provide input to regulatory developments through consultations and representation to industry bodies.

The Compliance function has authority to review all areas of the business and has full, free and unrestricted access to all activities, records, property and personnel necessary to complete its work.

## **B.5 Internal Audit function**

The Internal Audit function provides independent and objective assessment of the robustness of the RMF and the appropriateness and effectiveness of internal control to the Board, primarily via the Audit Committee. The Audit Committee receives quarterly control reports from Internal Audit and reviews and challenges management on the actions being taken to improve the quality of the overall control environment and the control culture across the Company.

### **B.5.1 Independence and objectivity of the Internal Audit function**

Internal Audit must be independent from management at all times in order to be effective in performing its activities. The Internal Audit Function maintains its independence and objectivity by reporting directly to the Group Chief Audit Officer and the Chairman of the Company's Audit Committee.

The Audit Committee has a duty to recommend the appointment or dismissal of the Internal Audit Director to the Board and to participate, jointly with the Chief Audit Officer or designee, in the determination of the objectives of the Internal Audit Director and the evaluation of his levels of achievement, including consultation with the Chief Executive Officer.

Internal Audit staff have no direct responsibility or authority over any operational activities reviewed and may not relieve others of such responsibilities. Internal Audit staff previously working on behalf of the Company, but outside of the Internal Audit function, may not perform or manage reviews of the Company for a period of at least one year after the end of their previous role. Internal Audit operates a formal policy of rotating staff to ensure that independence is maintained.

Internal Audit provides the Audit Committee with an annual confirmation of its independence, supported by an independence declaration form signed by all members of Internal Audit staff.

Internal Audit is authorised to review all areas of the Company and has full, free, and unrestricted access to all activities, records, property, and personnel necessary to complete their work.

## **B.6 Actuarial function**

The Actuarial function is accountable for actuarial methodology, reporting to the Board on the adequacy of reserves and capital requirements, and on the adequacy of underwriting and reinsurance arrangements.

The independence of the Actuarial function is derived through its membership in the wider Global Risk function. The Actuarial function is lead by the Chief Risk Actuary, who reports to the Company's Chief Risk Officer.

The Actuarial function has authority to review all areas of the business and has full, free and unrestricted access to all activities, records, property and personnel necessary to complete its work.

## **B.7 Outsourcing**

The Group Procurement and Outsourcing Standard is the Company's Outsourcing ("P&O") Policy which sets out the relevant responsibilities, objectives, process, and monitoring arrangements to be applied in cases of outsourcing, all of which shall be consistent with the overall business strategy. The standard applies equally to any externally or internally (intra-group) outsourced activity. The objective of this standard is to ensure that minimum control objectives and controls for Supplier related activities are followed by the Company, to ensure that supply risk is managed effectively, customers are being treated fairly and continue to receive good outcomes, as well as mitigating potential financial, operational, contractual, and brand damage caused by inadequate management.

The standard is benchmarked against UK regulatory expectations, FCA, PRA, Solvency II framework and Global Systemically Important Insurer requirements, and where appropriate, regulatory guidance will be applied as a requirement. Any local regulation that exceeds the UK expectations must supplement this.

The standard applies to all staff involved in supplier related activities and provides direction to staff on their roles and responsibilities in effectively managing supplier activity. It provides clarity to businesses on the definition of outsourcing, including where activity is delegated to an intermediary, and whether a function or activity outsourced is critical or important. All staff have a responsibility to comply with this standard if they are involved with supplier related activity.

The Group's Board Risk Committee approves the control objectives and controls in the standard which cover the following areas:

- Supply governance – business oversight of operational performance for sourcing and supply management activities;
- Sourcing – how a service provider of suitable quality is selected;
- Supplier contracting and approvals – financial, commercial and legal approval of contracts; and
- Supplier management and business continuity – risk based approach to management of supply contracts.

#### B.7.1 Outsourced functions and activities

The Group outsources a wide range of operational functions and activities, including policy administration, claims handling, customer contact centres and IT services. The Procurement and Outsourcing Standard requires a global Supplier Landscape document to be produced bi-annually to capture details of all critical or important outsourced operational functions and activities.

The Company has outsourced the following functions to other companies within the Group.

Supplier Name	Jurisdiction	Services provided
Aviva Central Services Limited	United Kingdom	Provision of Finance, People and Information Technology functions
Aviva Employment Services Limited	United Kingdom	Employment of the Company's staff
Aviva Investors Global Services Limited	United Kingdom	Investment management services
Aviva Life Services Limited	United Kingdom	Expenses management

The Company has not outsourced any critical or important arrangements to companies external to the Group.

## Risk Profile

### In this chapter

C Overview of the Company's risk profile

C.1 Underwriting risk

C.2 Market risk

C.3 Credit risk

C.4 Liquidity risk

C.5 Operational risk

C.6 Any other information

## Section C: Risk Profile

The 'Risk Profile' section of this report provides information on the key risks encountered by the Company as well as the corresponding processes for monitoring the risk exposures and the techniques in place for mitigating these risks.

### Overview of the Company's risk profile

For the purposes of risk identification and measurement, and aligned to the Company's risk policies, risks are usually grouped by the following principal risk types: underwriting risk, market, credit, liquidity and operational risk.

An overview of the Company's process for identifying, measuring, managing and monitoring the risks it faces is set out below, with further detail provided in sections C.1 to C.5.

#### Risk identification

The ultimate parent company, Aviva plc, and its related undertakings comprising the Group (including the Company) operate a risk framework which defines the enterprise-wide approach to managing risk, including how the Group identifies, measures, manages, monitors and reports on the risks to which it is, or could be, exposed. The Group has a variety of tools and processes to support the identification and measurement of the material risks the Group is (or could be) exposed to in the short, medium and long term. The risk framework has been adopted by the boards of the legal entities within the business collectively referred to as "UK Life" (principally consisting of this Company, UKLAP, Friends Life Limited and Friends Life and Pensions Limited).

Primary sources for identifying risks include risk events analysis, external and internal trends analysis and management information, as well as other risk governance processes and input from executive teams and internal committees. The key risk identification and measurement processes are set out below.

#### Exposure measurement and monitoring

The primary basis used by the Company to measure and assess risks is the Solvency II SCR which is calculated as Solvency II Own Funds at risk in a 1-in-200 year loss event over a 1 year time horizon. Solvency II SCR is the basis on which the Company sets solvency (economic capital) risk appetite and is used to assess the significance of risks and to appropriately direct resources to their management. Refer to section E.2 of this report for details of the methodology and assumptions used in the calculation of the Company's Solvency II SCR.

The primary risk types measured in the Company's Solvency II SCR calculation are:

- Underwriting risk (refer to section C.1);
- Market risk (refer to section C.2);
- Credit risk (refer to section C.3); and
- Operational risk (refer to section C.5).

Some categories of risk are not managed by holding capital, principally liquidity risk, which is measured through liquidity coverage ratios ("LCR"s) (see section C.4).

The Company also assesses risks on the basis of their potential impact on the value of the Company's franchise, which is supported by the Company's reputation, brand and good customer relationships. Operational risks, in particular, have the potential to significantly impact the franchise value (see section C.5) compared to other risk types which are relatively more significant measured on the basis of Solvency II SCR.

The Company also measures and assesses risk in terms of its total gross exposure and sum at risk, as well as monitoring risk indicators that might indicate changes in the risk exposure and act as a trigger for management action. These are generally risk type specific and are considered in sections C.1 to C.5.

#### Changes in the period to risk profile

Sections C.1 to C.5 include details on the key changes to the Group's risk profile in the reporting period.

## **Risk mitigation**

Risks arising across the Group are mitigated through application of elements of the Group's RMF, and in particular business standards in respect of financial risk mitigation and reinsurance. Risk mitigation techniques applied are explained in greater detail by risk type in sections C.1 to C.6.

### **Monitoring the effectiveness of risk mitigation techniques**

Annually the Group Risk function undertakes an assessment, presented to the Group Board Risk Committee, of the effectiveness of the Group's and business units' overall risk management, including specifically the robustness of their control environments in mitigating operational risk. The Group's major business units have dedicated risk monitoring teams which monitor the effectiveness of risk management in the business including risk mitigation. How the effectiveness of specific risk mitigation techniques is monitored is considered in sections C.1 to C.6.

## **Risk concentration**

The Company primarily writes annuity business that is subject to a number of risks (e.g. longevity and credit). The Company assesses the relative costs and concentrations of each type of risk through the Internal Model. This analysis enables the Company to assess whether accumulations of risk exceed risk appetite.

The main concentration of underwriting risk for the Company is improving longevity from pensions in payment. The Company continually monitors these risks and the opportunities for mitigating actions through reinsurance, improved asset liability matching, or innovative solutions that emerge in the market.

## **Sensitivity analyses**

The Company performs sensitivity analyses and stress and scenario testing in order to understand the impact that changes in underlying risk calibrations and correlation would have on the Company's risk profile, capital generation and SCR. Refer to section C.6.1 for details on the methodology employed, the assumptions and limitations in performing these analyses and the results obtained.

## **Prudent Person Principle**

The Company ensures that its assets are invested in accordance with the prudent person principle as set out in Article 132 (Directive 2009/138/EC) through the collective application of its risk policies and business standards. These ensure the Company invests in assets whose risks it can properly identify, measure, monitor, manage, control and report, and appropriately take into account in the assessment of its overall solvency needs. The Company's asset liability management business standard and certain provisions of the investment management business standard contain mandatory requirements to ensure that the Company develops its own set of key risk indicators and takes into account the risks associated with its investments without relying solely on the risk being adequately captured by the capital requirements. Risk appetites by risk type are also set and monitored by the Company. Other business standards set requirements for the quality of investment assets (including setting risk limits to control the market and credit risk within a portfolio), matching of assets to liabilities, diversification of invested assets, use of derivatives and assets.

## **C.1 Underwriting risk**

### **C.1.1 Exposure**

Underwriting risk is the risk of loss on underwriting activity caused by an adverse change in the value of liabilities. The principal life underwriting risks that the Company is exposed to are described below:

- Longevity risk: The risk that annuitants may live longer than expected.
- Expense risk: The risk that the future costs of managing and administering customer policies are higher than expected.

The Company chooses to take measured amounts of underwriting risk provided it has the appropriate core skills to assess and price the risk, and adequate returns are available.

### **Measurement**

The following measurement and analysis of underwriting risks is undertaken by the Company with appropriate frequency to support management and monitoring of risk exposures:

- High-level analysis of actual experience against expected experience to support ongoing monitoring of the appropriateness of assumptions.
- Economic capital calculations, consistent with Solvency II SCR methodology, for principal underwriting risk types. An allowance for basis risk in risk transfer arrangements is included, where appropriate, in the capital requirements for the underlying underwriting risks.
- Standard stresses for longevity and expense risks. This output is also used to inform liquidity risk analysis.
- Combined scenarios considering interest rate falls or rises where adverse experience has the potential to increase or decrease the duration of the liability. This output is also used to inform liquidity risk analysis.

The following analysis is undertaken on an annual basis, or more frequently if required, as part of the planning process to support management and monitoring of risk exposures.

- Business mix sensitivities to determine how economic capital requirements would move under different plan scenarios;
- Stress and scenario tests for assumptions that are identified as critical to the profitability and risk profile of the business based on standard stresses; and
- Liability adequacy/reserve coverage analysis is used to identify potential liquidity risks.

At 31 December 2016, the underwriting component of the SCR amounted to £1,068 million before diversification and tax.

### **Changes to risk profile in the reporting period**

The main changes in underwriting risk profile during 2016 are:

- A general reduction in risk due to the changes in reinsurance arrangements with All described in section A.1.3
- A general increase in exposure as falls in interest rates have increased liabilities on the balance sheet

### **C.1.2 Risk mitigation**

The individual underwriting risks are mitigated and managed as follows:

- Longevity risk is mitigated by use of reinsurance and are monitored against the latest external industry data, emerging trends and likely or possible future trends. The Company monitors exposure to longevity risk and any associated capital implications for its annuity business.
- Expense risk is primarily managed through the assessment of profitability and frequent monitoring of expense levels.

### **Monitoring the effectiveness of risk mitigation techniques**

Implementation of the risk mitigation techniques are discussed and then approved via the Company's governance forums (e.g. Asset and Liability Committee ("ALCO")), with ongoing effectiveness being monitored as part of 'business as usual' management information, the Group-wide Business Standards attestation process, and periodic Internal Audit reviews, significant findings from which are reported to the Audit Committee.

### **C.1.3 Risk concentration**

The Company's policy on underwriting risks is to avoid concentrations of risk exposure. Underwriting concentration risk is a reflection of too little diversification within or across underwriting risk types. The Company avoids significant concentrations of underwriting risk through its scale and concentration risk limits. Risk transfer solutions, primarily through reinsurance, are employed to transfer risks that the Company does not wish to retain due to the presence of single large exposures, accumulations, or limited internal expertise to the external market

Controls are in place to ensure accumulations of risk can be evaluated properly. Counterparty concentration as a result of underwriting activities and reinsurance arrangements and their management and monitoring are considered in section C.3.3.

## C.2 Market risk

### C.2.1 Exposure

Market risk is the risk of adverse financial impact resulting from changes in fair values or future cash flows of financial instruments due to fluctuations in interest rates and property prices. Market risk arises within the Company due to fluctuations in the relationship between the values of liabilities and the value of investments held.

The principal market risk types that the Company is exposed to are described below:

- Property price risk: The Company is subject to property price risk directly due to holdings of investment properties and indirectly through property collateral on commercial mortgage and equity release loans.
- Interest rate risk: Interest rate risk arises primarily from the Company's nominal and real yield curve exposure within both assets and liabilities.
- Inflation risk: Inflation risk arises primarily from the Company's exposure to expense inflation and exposure to inflation linked benefits within its annuity portfolio.
- Derivative risk: The Company is exposed to market risk through its derivative portfolio. Derivatives are used for efficient investment management, risk hedging purposes or to structure specific retail-savings products.
- Correlation risk: The Company recognises that market movements for many asset types are sensitive to, and interdependent with, changes in interest rates. These interdependencies are taken into consideration in the SCR and in scenario analysis.

#### Measurement

For each of the major components of market risk the Company has put in place additional policies and procedures to set out how each risk should be managed and monitored and the approach to setting appropriate risk limits and tolerances.

The management of market risk is undertaken by the Asset and Liability Management ("ALM") team, which is responsible for monitoring market risk, including the matching of assets and liabilities. Exposures by individual market risk types is monitored through economic capital modelling, sensitivity testing and stress and scenario testing, as well as specific measures for different risk types (for example, duration matching for interest rate risk). Derivative investment activity is overseen by the ALM and Risk teams, which monitor exposure levels and approval of large or complex transactions.

The principal basis used to measure the Company's exposure to market risks is the Solvency II SCR. The sensitivity of the Solvency II Balance sheet surplus and coverage ratio are also key measures of exposure, particularly to interest rate movements (as the SCR, risk margin and transitional measures on technical provisions ("TMTP") are themselves sensitive to movements in interest rates). In addition for each risk category, management is responsible for identifying key parameters to be used for risk measurement. For example:

- Shifts in key interest rate-/currency-related parameters relevant to market risk profile (for example term structure shifts, interest rate volatility, drift and correlation, slope and convexity);
- Changes in price level of individual assets or specific asset classes, e.g. debt securities, property;
- Changes in price volatility of individual assets or specific asset classes;
- Changes in realised and/or implied inflation; and
- Portfolio sensitivities (for example duration).

These parameters are monitored regularly and significant changes included in management information reported to the ALCO.

The Company is exposed to property price risk from sustained underperformance in the House Price Index ("HPI") on its equity release mortgage portfolio. The level of HPI is monitored and the impact of exposure to adverse HPI is regularly reviewed.

At 31 December 2016, the market risk component of the SCR amounted to £920 million before diversification and tax, and inclusive of the SCR related to credit risk from corporate and government bond holdings.

## Changes to risk profile in the reporting period

The main changes in market risk profile during 2016 are:

- A general reduction in risk due to the changes in reinsurance arrangements with All described in section A1.3
- A general increase in risk due to higher asset values on the balance sheet

### C.2.2. Risk mitigation

Risk mitigation actions by principal market risk types are described below.

- **Property price risk:** Investment in property is subject to investment limits, liquidity requirements and the expectations of policyholders. The financial impact from changes in property values is examined through stress and scenario analysis. Exposure to property risk on equity release mortgages from sustained underperformance in the HPI is mitigated by capping loan to value on origination at low levels and regularly monitoring the performance of the mortgage portfolio.
- **Interest rate risk:** The Company typically manages interest rate risk by adopting asset liability matching techniques, including the use of a variety of derivative instruments, to minimise the impact of mismatches between the value of assets and liabilities from interest rate movements. However where any mismatch is within the Company's risk appetite, the impact is monitored through economic capital measures.
- **Foreign currency exchange risk:** Currency risk from financial instruments held in currencies other than Sterling is limited, and is further mitigated by matching liabilities in local currency or hedging.
- **Inflation risk:** Exposure to inflation risk is monitored through economic capital modelling, sensitivity testing and stress and scenario testing. The Company typically manages inflation risk through its investment strategy and, in particular, by investing in inflation linked securities and through a variety of derivative instruments, including inflation linked swaps.
- **Derivatives risk:** Collateral is held against derivative transactions. Speculative derivative activity is prohibited. Over the counter derivative contracts are entered into only with approved counterparties, in accordance with the Company's policies. The Company applies strict requirements to derivative administration and valuation processes, and has a control framework that is consistent with market and industry practice.

### Monitoring the effectiveness of risk mitigation techniques

In accordance with the Group Financial Risk Mitigation business standard, the Company assesses and documents the effectiveness of arrangements in place to mitigate market and credit risks (financial risks). This assessment is initially undertaken when structuring arrangements and prior to execution. The assessment considers impacts on key metrics including measures of risk (primarily economic capital) and financial measures, including cash flow, IFRS operating profit and expenses. Where the initial assessment indicates that the impact on key metrics is material, further assessment is carried out at appropriately regular intervals throughout the life of the arrangement. These assessments typically include stress testing and sensitivity analysis. Transactions aimed at mitigating risk may be considered in aggregate with the relevant risks.

The Company's ALM team is responsible for monitoring the Company's market risk, including the effectiveness of risk mitigation techniques in place. The Company prepares regular management information on hedging arrangements to ensure appropriate oversight.

### C.2.3 Risk Concentration

The Company monitors its investment exposures, in aggregate across all classes of financial instruments to individual issuers, geographies, sectors, and asset classes to ensure the Company is not individually exposed to significant risk concentrations. Further information on how the Company manages, monitors and limits investment exposures is included in C.3.3.

## C.3 Credit risk

### C.3.1 Exposure

Credit risk is the risk of financial loss as a result of the default or failure of third parties to meet their payment obligations to the Company, or variations in market values as a result of changes in expectations related to these risks. Credit risk can provide the returns required to satisfy policyholder liabilities and generate returns for the Company's shareholders. Therefore

the Company is prepared to accept a degree of credit risk based on its credit risk analysis capability and the structural investment advantages conferred to insurers with long-dated, relatively illiquid liabilities.

The principal credit risk categories that the Company is exposed to are as follows:

- Spread risk is the risk that credit spreads over risk-free interest rates change. Credit concerns (improving or worsening) with respect to the issuer and market factors such as risk appetite and liquidity within the market can give rise to changes in credit spread.
- Default risk is the risk that a counterparty is unable or unwilling to meet its financial obligations when they fall due.
- Rating migration risk is the risk that a change in the external credit rating of a counterparty adversely impacts the Company.

Exposure of the Company to credit risk arises principally through the following asset holdings:

- Debt securities, including investments in sovereign and corporate bonds.
- Loans including mortgage loans and advances to banks.
- Reinsurance assets. Where the Company has reinsurance arrangements in place, credit risk arises in relation to the reinsurance counterparties.
- Other assets. Credit risk arises in relation to other assets, including structured investments, bank deposits and derivative counterparties.

#### **Measurement**

The principal basis used to measure the Company's exposure to credit risk is the Solvency II SCR. In addition, the following factors are used by the Company when measuring credit risk exposure.

- Maximum exposure: The Company's maximum exposure to credit risk of financial assets and reinsurance assets, without taking collateral, credit hedges or reinvestment risk into account, is represented by the carrying value of the financial assets and reinsurance assets recognised in the Solvency II balance sheet.
- Credit ratings: Credit ratings (both internal and external) are used as indicators of credit risk to help determine risk management actions, investment decisions and asset allocation.
- Loan specific factors: The Company uses loan to value, interest and debt service cover, and diversity and quality of the tenant base metrics to monitor exposures to commercial mortgage loans. The risk characteristics of commercial mortgage loans are assessed before acquisition and are monitored thereafter. The Company also uses loan to value to monitor exposure to equity release mortgage loans.

The majority of the Company's credit risk arises from corporate bond holdings, commercial mortgages and equity release mortgages. This credit risk is reported within the market risk component of the SCR. In addition to this, at 31 December 2016, the counterparty default risk component of the SCR amounted to £128 million before diversification and tax.

#### **Changes to risk profile in the reporting period**

The main changes in credit risk profile during 2016 are:

- A general reduction in risk due to the changes in reinsurance arrangements with All described in section A.1.3
- An increase in counterparty default risk exposure to All relating to the increased reinsurance
- A general increase in risk due to higher asset values on the balance sheet

#### **C.3.2. Risk mitigation**

The Company's approach to managing credit risk recognises that there is a risk of adverse financial impact resulting from fluctuations in the credit quality of third parties including default, rating transition and credit spread movements. The Company implements credit risk management processes including a limit framework (section C.3.3), operates specific risk management committees, and ensures detailed reporting and monitoring of its exposures against pre-established risk criteria.

The Company may also impose ad-hoc restrictions to control exposures. The Company also uses ad-hoc restrictions to reserve certain counterparties for a particular business activity. For example direct investment in the securities of principal reinsurance counterparties is restricted.

In addition to the risk mitigation techniques described above, specific credit risk mitigation techniques apply to certain portfolios of assets.

Mortgages are secured by property assets. Further credit risk mitigation is provided by maintaining a diversified portfolio in terms of property type, location, tenants and the spread of loans written over time.

The Company is also exposed to counterparty credit risk through derivative trades. This risk is mitigated through collateralising almost all trades (the exception being certain FX trades where it has historically been the market norm not to collateralise). Residual exposures are captured within the Company's credit management framework.

### **Monitoring of the effectiveness of risk mitigation techniques**

The processes for monitoring the effectiveness of risk mitigation techniques in respect of credit risk and market risk are set out in section C.2.2.

### **C.3.3. Risk concentration**

The Company operates a credit limit framework, which limits investments in individual issuers, geographies, sectors, and asset classes to ensure it is not exposed to significant concentrations of credit risk. Credit concentrations are monitored as part of the regular credit monitoring process and are reported to the ALCO.

#### **Credit limit framework**

The credit limit framework is based on three different layers (counterparty, sector and country) and is supported by a number of escalation frameworks which seek to ensure larger and/or higher risk transactions and activities are escalated appropriately. Specific escalation frameworks exist for ALM and investment decisions, and for derivative transactions.

The counterparty limit framework aims to avoid concentrations to single counterparties and to encourage issuer diversification within the portfolio. The limits combine to restrict the total exposure to a single counterparty, both in terms of balance-sheet exposure and shareholder exposure, and within that restrict the amount of high risk assets or exposures that can be held.

Concentration risk is further managed by sector concentration limits which are used to mitigate against, or manage, concentrations to specific sectors, and geographical areas to ensure appropriate geographical diversification and appropriate exposure limits depending on the risk profile of the country.

#### **Significant concentrations**

The Company holds a diversified portfolio of assets subject to credit risk due to its internal credit limit framework which limits exposure to individual concentrations of risk.

The Company is exposed to concentrations of risk with individual reinsurers, due to the nature of the reinsurance market. The Company places reinsurance with those reinsurers that have acceptable credit ratings. The Company operates a policy to manage its reinsurance counterparty exposures and the impact from reinsurer default is measured regularly, in particular through Solvency II stress and scenario testing.

## **C.4 Liquidity risk**

### **C.4.1 Exposure**

Liquidity risk is the risk that financial obligations to policyholders and other relevant external and internal parties cannot be met in a timely and cost-effective manner as they fall due. Liquidity issues may arise from uncertainty in the value and timing of liabilities as well as uncertainty in the ability to realise assets as cash to meet obligations.

Sources of liquidity risk are those activities or external factors that could alter the liquidity needs and liquidity resources in a stress scenario. The Company is responsible for identifying where liquidity risk exists and the factors that may increase the liquidity risks it faces at either the Company or specific fund level when setting risk appetite. Some examples of sources of liquidity risk are:

- Higher than expected claims. An increase in the level of annuity claims (for example through fewer deaths than expected) would increase the claims paid over the short to medium term.
- Collateral and margin calls on derivatives following movements in underlying market values.
- Timing mismatches in cash inflows and outflows including delays in reinsurance settlements and reinsurance defaults, and mismatches between annuity claims and expenses versus investment income and redemption proceeds.

#### **Measurement**

Liquidity risk appetite is expressed and measured through both absolute level targets and the LCR which measures the extent to which liquid assets held and stressed inflows are sufficient to meet liquidity requirements over a specified time horizon. The Company has short and long term risk appetites.

#### **Changes to risk profile in the reporting period**

There were no material changes in the Company's liquidity risk profile during 2016, as liquidity is managed gross of the reinsurance arrangement with All.

#### **Sensitivity analysis**

Stress and scenario testing, including reverse stress tests, is undertaken by the Company for the purpose of recovery planning and to test the resilience of the business plan. This testing specifically considers impacts on the Company's liquidity position.

#### **C.4.2 Risk mitigation**

The Company manages and mitigates its exposure to liquidity risk as follows:

- A liquidity risk appetite is set which requires that sufficient liquid resources be maintained to cover net outflows in a stress scenario.
- Maintenance of undrawn committed borrowing facilities – the Company has no direct borrowing facility, but has access to the undrawn committed borrowing facilities of its parent, UKLAP.
- Asset liability matching methodology which optimises asset portfolio maturity structures to ensure cash flows are sufficient to meet liabilities when they fall due.

In addition the Company has access to a contingent funding plan that permits limited borrowing from other companies within UK Life, and may also request additional borrowing from other Group companies (subject to relevant approvals). To pre-empt the need to initiate the contingent funding plan, the Company sets liquidity buffers and triggers to enable action to be taken before target levels are breached.

#### **Monitoring the effectiveness of risk mitigation techniques**

In addition to the overall monitoring of the risk mitigation techniques described in the Overview section, the Company monitors the effectiveness of its liquidity risk mitigation as follows:

- Assurance work (e.g. testing) to ensure that controls that enable effective risk management are in place and work effectively.
- Continual monitoring of actual and projected liquid resources and cash inflows and outflows against liquidity risk appetites and liquidity buffers.

#### **C.4.3 Risk concentration**

Concentration of liquidity risk can occur if the Company's assets are invested in a limited number of issuers, asset classes and sectors and, in the event of an external shock, market liquidity for these investments disappears and the assets can not be realised for cash. The measures taken to avoid such risk concentrations are set out in section C.3.3.

The diversity of sources of liquidity available to the Company helps reduce concentration of liquidity risk.

## C.5. Operational risk

### C.5.1 Exposure

Operational risk is the risk of loss, arising from inadequate or failed internal processes, people and systems, or external events including changes in the regulatory environment. There is a limited tolerance for operational risk and the aim is to reduce this risk as far as is commercially sensible.

Conduct risk is an aspect of operational risk and is the risk that positive customer outcomes are not achieved. It arises throughout the whole product lifecycle from the development of products, from the sales process to servicing policies and handling claims.

Reputational risk can result from operational risk. This is the risk that litigation, employee misconduct, operational failures, the outcome of regulatory investigations, media speculation and negative publicity, disclosure of confidential client information, and inadequate services (whether or not founded) could impact the Company's brands or reputation. Any of either the Company's brands or reputation could also be affected if products or services recommended by the Company (or any of its intermediaries) do not perform as expected (whether or not the expectations are well founded) or if customers' expectations for the product change.

#### Measurement

The RCSA process, as described in section B.3.1, is used to identify operational risks. The process involves the mapping of identified operational risks to operational processes, the identification of mitigating controls and an assessment of the effectiveness of these controls. A residual risk impact and probability assessment is then performed. Residual impact is assessed quantitatively on the basis of financial loss and misstatement, and qualitatively, for reputational and conduct considerations.

To the extent that operational risks cannot be fully mitigated and in recognition of the risk of control failure (i.e. due to ineffectiveness in design or performance), the Company holds economic capital to cover these risks within the Solvency II SCR.

#### Changes to risk profile in the reporting period

The Company's exposure to risk such as data theft, conduct regulatory breaches and customer service interruption due to IT systems failure increased in 2016 as a result of the following factors:

- The increasing importance to the Company's strategy of digital interaction with its customers and advanced data analytics.
- The conduct agenda of the European Insurance and Occupational Pensions Authority ("EIOPA"), the FCA and other regulators.
- The increasing cyber security threat, as evidenced by a number of high profile cyber security breaches for corporates in the UK and elsewhere.

The exposure is expected to continue to increase into the future.

### C.5.2 Risk mitigation

Most operational risks are considered preventable and are managed through business controls. The Company's preference is to improve its business processes through reduction of errors and rework, in order to achieve:

- Reduced operational risk and associated losses, hence improving cost to income ratio and lessening variability in financial performance;
- Improved customer outcomes and employee satisfaction;
- Sustained customer confidence; and
- A positive regulatory reputation.

The Group's business standards set out the minimum control objectives and controls that each business area is expected to have in place. Operational risk limits and tolerances act as quantitative boundaries that constrain specific risk-taking activities at an operational level.

The Company records and analyses operational risk events, arising from inadequate or failed processes, people or systems or external events, to ensure remedial action is taken, lessons are learnt and where the event impacts customers they are

treated fairly. As well as events that result in losses, this includes risk events which do not give rise to a financial loss, such as near misses or fortuitous gains and also reputational and customer impacts. The lessons learned enable business areas to highlight areas for improvement, implement corrective actions to avoid recurrence, and improve the Company's risk assessment and understanding of operational risk, feeding into the RCSA process.

### **Monitoring of the effectiveness of risk mitigation techniques**

All of the three lines of defence have an important role to play in monitoring the effectiveness of the controls that are in place in respect of operational risk. More details on these three lines of defence are included in section B.1.1.

#### **C.5.3 Risk concentration**

Concentrations of operational risk arise when there is dependency on a single supplier to provide a product or service supporting a business critical function. The Company is required to identify such business critical outsourced functions (internal and external) and for each have exit and termination plans and business continuity and disaster recovery plans in the event of supplier failure. These plans are required to be reviewed at least annually.

The Company's operations are spread across a number of geographical office locations helping to ensure continuity of service if a catastrophic event results in an office being out of action. Additionally, the Company has a series of business continuity plans in place for critical functions which should ensure continuity of service to its customers without significant interruption.

Most of the Company's products are sold under the 'Aviva' brand, enabling the Company to leverage the strength of the brand and supporting delivery of the 'True Customer Composite' anchor to its business strategy. The Company is therefore particularly vulnerable to any operational failures that could adversely impact public perception of the 'Aviva' brand.

## **C.6 Any other information**

### **C.6.1 Sensitivity analyses**

As set out in the Risk Profile Overview section, the primary basis used by the Company to measure risks is the Solvency II SCR. The Company performs sensitivity analysis, stress and scenario testing in order to understand the impact that changes in underlying risk calibrations (and correlations of those risks) would have on the Company's risk profile and Solvency II coverage ratio. This section describes the sensitivity analyses performed, and section C.6.2 describes the Company's stress and scenario testing.

The sensitivity analyses performed by the Company include consideration of the sensitivity of the Company's Solvency II cover ratio to a range of economic and non-economic assumptions as follows:

#### **Economic assumptions**

- 25 and 100 basis point increases and 25 and 50 basis point decreases in the risk-free rate, including all consequential changes (including assumed investment returns for all asset classes, market values of fixed interest assets and risk discount rates).
- 50 and 100 basis point increases and 50 basis point decrease in credit spreads for corporate bonds with credit rating A at 10 year duration, with the other ratings and durations stressed by the same proportion relative to a stressed capital requirement.

#### **Non-Economic assumptions**

- 10% increase in maintenance expenses and investment expenses.
- 5% decrease in mortality rates for annuity business.

All other assumptions remain unchanged for each sensitivity, except where these are directly affected by the revised economic conditions or where a management action that is allowed for in the SCR calculation is applicable for that sensitivity.

Transitional relief on technical provisions is assumed to be recalculated in the interest rate and annuitant mortality sensitivities. The credit spread sensitivities assume that the fundamental spreads ("FS"s) remain unchanged. The MA is assumed to change by 77.5% of the change in credit spread.

The table below shows the absolute change in cover ratio under each sensitivity,:

Sensitivities (net of tax and gross of non-controlling interests)		Absolute change in solvency cover ratio excluding ring fenced funds
Changes in Economic assumptions	25 bps increase in interest rate	6%
	100 bps increase in interest rate	23%
	25 bps decrease in interest rate	(6)%
	50 bps decrease in interest rate	(11)%
	50bps increase in corporate bond spread	10%
	100bps increase in corporate bond spread	20%
	50 bps decrease in corporate bond spread	(10)%
Changes in Non-Economic assumptions	10% increase in maintenance and investment expenses	(1)%
	5% decrease in mortality rates - annuity business	(28)%

#### Limitations of sensitivity analysis

The table above demonstrates the effect of a change in a key assumption while other assumptions remain unchanged. In reality, there is a correlation between the assumptions and other factors. It should also be noted that these sensitivities are non-linear, and larger or smaller impacts should not be interpolated or extrapolated from these results.

The sensitivity analysis does not take into consideration that the Company's assets and liabilities are actively managed. Additionally, the Solvency II position of the Company may vary at the time that any actual market movement occurs. For example, the Company's financial risk management strategy aims to manage the exposure to market fluctuations.

As investment markets move past various trigger levels, management actions could include selling investments, changing investment portfolio allocation and taking other protective action. Other limitations in the above sensitivity analysis include the use of hypothetical market movements to demonstrate potential risk that only represent the Company's view of possible near-term market changes that cannot be predicted with any certainty, and the assumption that all interest rates move in identical fashion.

#### C.6.2 Stress and scenario testing

Stress and scenario testing (including reverse stress testing) is used to test the resilience of business plans and strategic projects (including material portfolio changes such as those related to products, customers and distributors) and inform decision-making. A series of stress tests are performed to analyse their impact on the Company's solvency. These tests include the Company 1-in-X reference stresses driven by the Company's risk profile as well as several scenarios as part of the Company's Recovery Planning and Liquidity Risk management planning processes

# Section D

## Valuation for Solvency Purposes

### In this chapter

D.1 Assets

D.2 Technical provisions

D.3 Other liabilities

D.4 Alternative methods of valuation

## Section D: Valuation for Solvency Purposes

The 'Valuation for Solvency Purposes' section of the report provides a description of the bases, methods and main assumptions used in the valuation of assets, technical provisions and other liabilities for each material asset and liability class.

Assets and liabilities under Solvency II are valued in accordance with the Company's accounting policies under IFRS as adopted by the European Union ("EU"), unless stated otherwise in sections D.1 'Assets', D.2 'Technical provisions' and D.3 'Other liabilities'. A summary of the Company's accounting policies can be found in the accounting policies note of the Company's 2016 financial statements.

The table below sets out a summarised balance sheet as at 31 December 2016. It compares assets and liabilities as reported in the financial statements (column a), a reclassified IFRS balance sheet as presented in the balance sheet QRT (column b) and the Solvency II balance sheet (column d).

Where differences are present, either in respect of the classification or measurement of assets or liabilities between IFRS and Solvency II, they have been presented in the table below, in columns (c) and (e) and a qualitative description provided for all material items in sections D.1 Assets, D.2 Technical provisions or D.3 Other liabilities.

### Balance Sheet – IFRS and Solvency II

	Note from financial statements	Note	IFRS (a) £m	IFRS Reclassified (b) £m	Variance (b-a) (c) £m	Solvency II (d) £m	Variance (d-b) (e) £m
As at 31 December 2016							
<b>Assets</b>							
Property, plant and equipment held for own use	L & 7		3	-	(3)	-	-
Investment property	M & 8	D.1.1	172	175	3	175	-
Participations	K & 6	D.1.2	2	911	909	909	(2)
Financial investments	O & 12	D.1.3	21,288	22,546	1,258	22,546	-
Loans and Mortgages	Q & 10	D.1.4	17,912	18,200	288	18,218	18
Reinsurance recoverables	J & 13	D.1.5	26,259	26,259	-	31,161	4,902
Cash and cash equivalents	T & 28(b)	D.1.6	2,305	179	(2,126)	179	-
Receivables (insurance, reinsurance and intermediaries)	S & 14	D.1.7	1,022	1,199	177	1,199	-
Other assets (including prepayments and accrued income)	15	D.1.8	619	51	(568)	51	-
<b>Total assets</b>			<b>69,582</b>	<b>69,520</b>	<b>(62)</b>	<b>74,438</b>	<b>4,918</b>
<b>Liabilities</b>							
Technical provisions	H & 19	D.2.1	36,135	36,135	-	40,603	4,468
Deferred tax liabilities	V & 22(b)	D.3.1	56	56	-	130	74
Derivatives	P & 24	D.3.2	1,485	1,480	(5)	1,480	-
Debts owed to credit institutions	S & 24	D.3.3	1	1	-	1	-
Financial liabilities other than debts owed to credit institutions	S & 24	D.3.3	971	832	(139)	832	-
Insurance and intermediaries payables	S & 24	D.3.3	50	50	-	50	-
Deposits from reinsurers and Reinsurance payables	S & 24	D.3.3	28,873	28,873	-	28,887	14
Payables (trade, not insurance)	S & 24	D.3.3	59	141	82	141	-
Subordinated liabilities	W & 23	D.3.3	200	200	-	206	6
<b>Total liabilities</b>			<b>67,830</b>	<b>67,768</b>	<b>(62)</b>	<b>72,330</b>	<b>4,562</b>
Excess of assets over liabilities			1,752	1,752	-	2,108	356

There are a number of classification differences between the presentation of the balance sheet in the financial statements and the Solvency II balance sheet which have no material net asset impact and therefore no impact on Solvency II measurement. The key differences relate to reclassification of investment funds and deposits other than cash and cash equivalents (refer to column c in the table above).

A number of valuation differences exist in respect of the assets and liabilities reported in the Company balance sheet under Solvency II compared to IFRS as at 31 December 2016. The nature of the material differences are set out in section D.1 'Assets', D.2 'Technical provisions' and D.3 'Other liabilities'. The net impact of these differences is an increase in net assets of £356 million. This primarily reflects the differences in assumptions and reserving methodology used to value technical provisions under Solvency II compared to IFRS.

## **D.1 Assets**

Assets have been valued according to the requirements of the Solvency II Directive and related guidance; the basis of the Solvency II valuation principle is the amount for which they could be exchanged between knowledgeable willing parties in an arm's length transaction.

A description of the basis of valuation under Solvency II along with valuation differences between the Solvency II bases and the IFRS financial statements, by asset class, is provided below.

### **D.1.1 Investment property**

Investment property is measured at fair value for both Solvency II and IFRS purposes. The fair values are assessed by qualified external valuation specialists or by qualified staff and reflect rental income and other assumptions that market participants would use when pricing the investment property under current market conditions.

### **D.1.2 Participations**

The Company's participations in related undertakings are valued in the Solvency II balance sheet at the Company's proportionate equity share of the excess of assets over liabilities (valued on a Solvency II basis) of each related undertaking.

Under IFRS, subsidiaries, associates and joint ventures are stated at their fair values, estimated using applicable valuation models.

### **D.1.3 Financial investments**

All financial investments are measured at fair value for both Solvency II and IFRS purposes. Fair value is obtained from quoted market prices or, if these are not available, by using relevant valuation techniques. Further information on financial investments valued using an alternative method to either a quoted market price or a quoted market price for a similar asset is included in section D.4.

### **D.1.4 Loans and mortgages**

Under Solvency II loans are measured at fair value. The valuation technique used is an income approach, which reflects the present value of cash flows the loan is expected to generate calibrated as far as possible to market observable parameters.

Under IFRS the majority of loans are recognised at their fair values. Certain loans, however, are carried at amortised cost. There is a valuation difference of £18 million in relation to loans held at amortised cost under IFRS.

### **D.1.5 Reinsurance Recoverables**

Reinsurance recoverables are calculated as a probability-weighted average of discounted future cash flows relating to reinsurance contracts, adjusted for the expected losses due to counterparty default. Only reinsurance cash flows that relate to cash flows included in the best estimate liability are included. The difference in value under Solvency II compared with IFRS is driven by the differences in valuation methodology for technical provisions (refer to section D.2.4). All internal reinsurance is valued in the same way as external reinsurance.

### **D.1.6 Cash and cash equivalents**

Cash and cash equivalents comprise cash at bank and in hand, deposits held at call with banks, treasury bills and other short term highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of change in value. Such investments are those with less than three months' maturity from the date of acquisition, or which are redeemable on demand only with an insignificant change in their fair values. Under Solvency II cash is valued in accordance with IFRS principles.

### **D.1.7 Receivables (insurance, reinsurance and intermediaries)**

Under Solvency II, receivables are held at fair value, being the amount for which they could be exchanged between knowledgeable parties in an arm's length transaction. All the Company's receivables are due within one year. Where receivables are expected to be recovered within one year, the Solvency II fair value is equal to the IFRS carrying value.

### **D.1.8 Other assets**

Other assets consist of prepayments and accrued income which are held at fair value under both Solvency II and IFRS.

## D.2 Technical provisions

This section provides a definition of Solvency II technical provisions, the methodology and main assumptions used in the valuation of the Solvency II technical provisions, the total value of Solvency II technical provisions split by material lines of business, a comparison of the valuation of Solvency II technical provisions with IFRS technical provisions and a description of the level of uncertainty in technical provisions.

### D.2.1 Definition of Technical Provisions

The value of technical provisions under Solvency II is equal to the sum of a best estimate liability and a risk margin.

The best estimate liability is defined as the probability-weighted average of the present value of future cash flows on a market consistent basis, using the relevant risk-free interest rate term structure after making allowance for the credit risk adjustment ("CRA") and MA as required (described in section D.2.2.2).

The risk margin is an allowance for the amount, in addition to the best estimate liability, that a third party (buyer) would expect to receive in order to take over the insurance obligations of an existing entity. It is calculated as the present value of a cost of capital each year in respect of non-hedgeable risks.

Technical provisions also include the TMTP which allows firms to transition from the Solvency I liabilities to the Solvency II technical provisions over a period of 16 years for business written prior to the Solvency II implementation date of 1 January 2016. This is described in more detail in section D.2.2.1(c).

The following general principles apply to technical provisions valuation:

- The calculation of technical provisions is performed on a going concern basis. This means a proportion of expected future costs (such as general overheads) will be covered by future new business.
- The definition of a "best estimate" assumption is one that represents the expected outcome from the range of possible outcomes for future experience of that assumption and is reasonable and realistic with no deliberate margins for prudence included.

### D.2.2 Technical provisions methodology and assumptions

Technical provisions are calculated in accordance with the Solvency II Directive, Delegated Regulations and regulator guidance. This section describes how the rules and guidance have been applied to the Company. Unless otherwise stated the methodology and assumptions apply to all types of business.

#### D.2.2.1 Methodology

##### (a) Valuation methodology

###### Cash flow modelling

When deriving the probability-weighted average of the present value of future cash flows, a deterministic valuation approach, based on best estimate assumptions, is used for most of the business. The best estimate liability is calculated separately for cash flows in different currencies. Reinsurance cash flows are modelled as well as cash flows gross of reinsurance.

Future investment returns are also projected in order to determine the value of such items as investment expenses.

###### Policy grouping

The cash flow projections used in the calculation of the best estimate liability for life insurance business are made separately for each policy.

###### Reinsurance accepted

Reinsurance accepted is valued in the same way as direct written business using a discounted cash flow approach.

There are also other smaller blocks of reinsurance accepted business.

##### (b) Valuation components

###### Cash flows in scope

For life insurance obligations (lines of business 29-32), all cash flows (including any charges related to embedded options) required to settle the insurance liabilities over their lifetime are taken into account.

The table below summarises the main cash flows that are modelled:

Gross cash in-flows	Gross cash out-flows
Future premiums (gross of commissions).	Benefits including: Annuity payments.
	Expenses including administrative expenses, investment management expenses, claims management expenses (direct and indirect), acquisition expenses including commissions which are expected to be incurred in the future, renewal commission.
	Other items which are charged to policyholders (or required to settle the obligations): Taxation
Reinsurance cash in-flows	Reinsurance cash out-flows
Reinsurance recoveries in respect of gross claims/benefit payments.	Future reinsurance premiums (including adjustment premiums and reinstatement premiums).
Reinsurance commissions including profit commissions.	Commissions.
Floating leg payments in respect of longevity swaps.	Reinsurance refunds.
	Fixed leg payments in respect of longevity swaps.

### Annuity payments

The conventional immediate and deferred annuity business is valued by discounting future benefit payments with an allowance for mortality, including future improvements in mortality. Where the benefits are linked to inflation, a market implied inflation curve is used in projecting the future annuity payments, applied in line with policy terms and conditions.

### Reinsurance cash flows

The valuation of reinsurance cash flows is not a component of technical provisions. However, the value is included within Reinsurance Recoverables in the balance sheet (see section D.1.8).

### (c) Transitional arrangements (unaudited)

The TMTP allows firms to transition from the Solvency I liabilities to the Solvency II technical provisions over a period of 16 years for business written prior to the Solvency II implementation date of 1 January 2016. The TMTP is recalculated at least every 2 years with the first recalculation on these grounds being on 1 January 2018. A recalculation may also be undertaken if a company's risk profile materially changes. The TMTP was last recalculated for the Company at 1 July 2016 reflecting operating conditions at that point.

An unrestricted TMTP is based on the difference between the following two amounts:

- The technical provisions on a Solvency II basis, including the impact of the MA and VA where applicable, and after deduction of amounts recoverable from reinsurance at the valuation date;
- The Solvency I Pillar 2 (ICA) technical provisions, after deduction of the amounts recoverable from reinsurance and allowing for any relevant individual capital guidance ("ICG") at the valuation date.

The TMTP is restricted to ensure that the Solvency II financial resources (defined as the sum of the Solvency II technical provisions and other non technical liabilities after application of transitional relief and the SCR) are no lower than the most onerous of the Solvency I Pillar 1 financial resources and Solvency 1 Pillar 2 financial resources (defined as the sum of the Pillar 2 technical provisions, other non technical liabilities, SCR plus ICG).

The TMTP is calculated at company level and is applied to technical provisions for the relevant funds. Within technical provisions the TMTP is applied to the risk margin first. Where the total TMTP exceeds the total risk margin (in respect of business written prior to the Solvency II implementation), the excess is allocated to the best estimate liability. Within risk margin and best estimate liabilities, TMTP is allocated to each line of business in proportion to its contribution to the total deduction. Where a line of business contributes a negative amount to the TMTP, this is zeroised and allocated to the other lines of business.

The impact of removing the TMTP is set out below:

31 December 2016	Including TMTP (A)	Setting TMTP to zero (B)	Impact of removing TMTP (C) = (B) – (A)
	£m	£m	£m
Technical Provisions	40,603	41,822	1,219
Basic Own Funds	2,314	1,229	(1,085)
Eligible Own Funds to meet SCR	2,314	1,229	(1,085)
SCR	1,126	1,260	134
MCR	282	315	33

The impact from the TMTP on SCR arises because the TMTP is treated as an asset, which generates a corresponding deferred tax liability. The SCR represents a 1-in-200 loss scenario, and may be reduced by the deferred tax asset created by the loss to the extent that there are sufficient liabilities to offset the loss. The TMTP deferred tax liability can increase the tax relief on the SCR, and therefore removal of the TMTP may increase the SCR.

#### D.2.2.2 Assumptions

The definition of a “best estimate” assumption is one that represents the expected outcome from the range of possible outcomes for future experience of that assumption and is reasonable and realistic with no deliberate margins for prudence included.

The table below summarises the main assumptions used in the calculation of the best estimate liability:

Economic Assumptions	Non-Economic Assumptions
Risk-free rates	Annuitant mortality
CRA	Expenses
MA	
Reinsurance counterparty default allowances	
Expense inflation	
Tax	

Economic assumptions are reviewed quarterly while non-economic assumptions are reviewed at least on an annual basis to ensure that these remain appropriate, relevant and realistic. The choice of assumptions is validated through experience analyses and, where available and appropriate, benchmarked against external sources.

Approximations are employed where credible data is unavailable, predominantly for small blocks of business or assumptions considered to be relatively immaterial.

#### (a) Economic assumptions

The economic assumptions for all lines of business are set out in the sections below. The basic risk-free rate curves used to value the technical provisions reflect the curves, CRA, and FS for the MA published by EIOPA.

#### Risk free discount rates

The GBP risk-free rates at key durations, used to value the technical provisions at full year 2016 are stated in the table below. The figures shown below allow for a CRA of 17 bps on GBP.

Risk-free rates (bps)	1 year	5 years	10 years	15 years	20 years	40 years
GBP	38	70	108	127	132	117

Where swaps do not exist or are not sufficiently liquid or reliable from a certain point, the basic risk-free interest rate is extrapolated in a smooth progression. EIOPA has prescribed by currency the entry points for extrapolation, the duration to convergence and the ultimate forward rate, as shown in the table below.

Currency	Entry point for extrapolation of risk-free rates (years)	Duration to convergence to ultimate forward rate (years)	Ultimate forward rate pa
GBP	50	90	4.20%

## MA

The MA is an increase applied to the risk-free rate used to value insurance liabilities where the cash flows are relatively fixed (e.g. no future premiums or surrender risk) and are well matched to assets that are intended to be held to maturity and have cash flows that are also relatively fixed. The intention is that, if held to maturity, the business can earn the additional yield on these assets that relates to illiquidity risk.

The PRA has approved the application for the MA to be applied in the Company.

The MA used for YE2016 is shown in the table below. The MA shown below applies to technical provisions net of reinsurance retained in UKA.

MA (bps)	YE2016
GBP	172

The MA is derived from the spread over risk-free on the assigned portfolio of assets, net of an allowance for default and downgrade (known as the FS). The FSs applied are prescribed by EIOPA.

The table below shows the asset classes that are considered to be eligible for the MA portfolio, with the market value of those assets used for the MA calculation. The table below includes the deposit withheld assets in respect of the All and UKLAP Quota Share reinsurance arrangements.

31 December 2016 Market Value (£m)	Total eligible assets
UK Government bonds	1,503
Overseas Government and Supranational bonds	2,128
Corporate bonds	13,851
Commercial mortgages	7,337
PFI loans and Infrastructure	3,602
Equity release fixed rate note	5,172
Other	880
<b>Total</b>	<b>34,473</b>

Equity release mortgage assets meet the criteria for inclusion within the MA when they are securitised into an internal Special Purpose Vehicle ("SPV"), which then issues a fixed coupon note (equity release fixed rate note) secured by those assets to the MA portfolio of the Company. The equity release mortgage assets that have been restructured in this way do not meet the IFRS de-recognition criteria and are therefore still presented on the IFRS and Solvency II balance sheets.

Commercial mortgages and the equity release fixed rate notes eligible for inclusion within the MA are assigned an FS based on an internal credit rating set in accordance with the internal rating methodology framework.

The impact of Long Term Guarantees and Transitional measures is disclosed in QRT S.22.01.01 using a step-by-step approach. The quantification of setting the MA to zero is set out below:

	Including MA (A)	With MA set to zero (B)	Impact of removing MA (C) = (B) – (A)
<b>31 December 2016</b>			
Technical Provisions	40,603	42,819	2,216
Basic Own Funds	2,314	98	(2,216)
Eligible Own Funds to meet SCR	2,314	98	(2,216)
SCR	1,126	2,422	1,296
MCR	282	606	324

The impact on eligible Own Funds to meet SCR in the table above includes the loss of MA. Note that the quantification of the impact of setting the MA to zero is after the removal of TMTPs. In practice the impact may be lower if the Company were able to apply the VA in place of the MA should the latter no longer be available.

### Reinsurance counterparty default allowances

Reinsurance counterparty default risk for both internal and external counterparties is allowed for in calculating the best estimate liability. Reinsurance counterparty default in the best estimate liability depends on:

- the probability of default based on the credit rating of the counterparty and the year of projection; and
- the recovery rate which is a constant over time, but varies by reinsurer.

### Expense inflation

Future charge inflation for the majority of the business is defined in the Management Service Agreement ("MSA") between the Company and Aviva UK Life Services ("UKLS"), the service company.

For those products not covered by the MSA, an expense inflation assumption of 100% of RPI inflation is used.

### Tax

The tax assumptions used at 31 December 2016 are shown in the table below.

Parameter	31 December 2016
Corporation tax (current year)	20%
Corporation tax (future profits)	17%

### (b) Non-economic assumptions

#### Annuitant Mortality

Recent mortality experience is regularly reviewed in order to set assumptions. The investigations carried out cover the majority of the Company's annuity business and are performed on both a lives and an amounts basis.

Annuitant mortality assumptions are required for both deferred annuity and in-payment annuity business and fall into three main categories:

- base tables
- adjustments to base tables
- future improvements

Base tables describe the current levels of mortality. The base tables are different for males and females and also include an adjustment for anti-selection that varies by individual year of entry.

Adjustments to base tables include allowances for policyholder or scheme specific factors.

Future improvements are the most material element of longevity assumptions and the most uncertain.

For the main pension annuity business in the Company, the underlying mortality assumptions for males are 99.5% of PCMA00 and for females 92.5% of PCFA00, both with a base year of 2000. Improvements are based on CMI\_2015 with a long-term improvement rate of 1.75% pa for males and 1.5% pa for females.

#### Expense assumptions

The best estimate liability for future expenses is a combination of the following elements:

- Administration charges in line with the MSA between the Company and UKLS;
- Costs charged by UKLS for administering business for those lines of business which are charged on a "cost-plus" basis;
- Reserves for additional (e.g. regulatory and audit fees) and exceptional costs in excess of the above cash flows; and
- Allowances for investment expenses which are expected to be incurred in managing the asset portfolio, calculated as a proportion of assets under management.

#### Other assumptions

##### *Events not in data ("ENID")*

The term ENID refers to any events not deemed to be captured by the data, which need to be allowed for within the best estimate calculation to allow for the uncertainty in the future cash flows. ENIDs are considered both at line of business level, and at portfolio level with allocations to lines of business, depending on the scenario being considered.

The Company considers ENID through either adjusting the best estimate assumptions to ensure the likely impact of the event is included or using a scenario approach where they are expected to be material. Expert judgement is applied to determine the expected impact on future experience.

### **(c) Consistency of assumptions**

The calculation of the best estimate liability requires a number of projection assumptions to be used. These assumptions are consistently reflected in both the valuation of technical provisions and the calculation of the SCR where necessary.

There are also a number of modelling dimensions across which consistency is ensured. These include using the same asset and liability data for both the SCR calculation and the technical provision valuation and ensuring that the calibrations and calculations used are consistent across the Internal Model. There are a number of specific areas of consistency:

- Insurance risk factor calibrations are often based on estimates of uncertainty, for example predicting future mortality rates for longevity risk. The same methodology is used to calibrate this uncertainty as is used to calculate the best estimate of liabilities – i.e. reflecting the base mortality levels and future mortality improvement factors.
- In order to value the reinsurance recoverables for technical provisions, assumptions are set for the rate of external reinsurer counterparty default. These assumptions are aligned with the counterparty default rates used in the credit portfolio model to calculate the probability of default for credit risk exposures.

### **D.2.2.3 Risk margin methodology (unaudited)**

The risk margin is calculated for the Company using a Cost of Capital (“CoC”) approach allowing for diversification between lines of business and is on a net-of-reinsurance basis. The CoC rate is the cost in excess of the risk-free rate, to a third party taking over the liabilities, of raising and holding capital to support the non-hedgeable risks over the lifetime of the business. The same CoC rate is used for all insurance companies and is prescribed by EIOPA at 6% per annum.

The risk margin is underpinned by the non-hedgeable SCR (“nhSCR”). This takes into account the following risks:

- Life underwriting risk
- Counterparty default risk with respect to reinsurance contracts, arrangements with debtors and any other material exposures which are closely related to the insurance obligations
- Operational risk

The Company has no material non-hedgeable market risk to include.

The rate used to discount the projected nhSCR is the basic risk-free rate (including CRA), with no allowance for volatility or MAs.

### **Projection of the SCR**

The Company adopts a mix of approaches to non-hedgeable risk projections. For some risks the projected run-off is exact and no approximation is made. For others the Company makes use of risk carriers, where a suitable statistic is chosen which can be readily projected and used as a proxy.

The projected risks are then aggregated using a correlation matrix approach at each future time period to derive the nhSCR. Adjustments are made to reflect the differences between the correlation matrix approach and the Internal Model.

### **Diversification**

The risk margin allows for diversification at the Company level.

### **Loss absorbing capacity**

The loss absorbing capacity of technical provisions assumed in the calculation of the nhSCR is consistent with the loss absorbing capacity of technical provisions assumed in the calculation of the SCR. No allowance for the loss absorbency of deferred taxes is included in the risk margin.

### **Allocation of the risk margin to Solvency II lines of business**

The risk margin is allocated to line of business using a matrix approximation for Internal Model business and using nhSCRs for Irish business within fund which is on Standard Formula basis.

### D.2.3 Value of Technical Provisions by Line of Business

The following table sets out the technical provisions for the Company, split by Solvency II lines of business, as detailed in Annex I to the Level 2 Delegated Acts. The table sets out only those lines of business that are applicable to the Company. The best estimate liability and the risk margin are provided separately. These figures are gross of reinsurance and after the impact of transitional measures.

#	Line of Business As at 31 December 2016	Technical provisions	Best Estimate	Risk Margin
32	Other life insurance	39,797	39,903	(106)
34	PPOs not health	63	60	3
D	Life insurance obligations	39,860	39,963	(103)
36	Life reinsurance	743	693	50
E	Life reinsurance obligations	743	693	50
	Total	40,603	40,656	(53)

The methodology and assumptions used to calculate the technical provisions are set out in section D.2.2 above.

### D.2.4 Comparison of Solvency II Technical Provisions to IFRS Technical Provisions

Solvency II technical provisions are comprised of two components – the best estimate liability and the risk margin. By contrast, the IFRS provisions are a single calculation of liabilities, with appropriate margins for risk included within the assumptions and/or methodology. There is also a different approach to discounting.

There are specific differences in the methods used relating to the risk margin. The material differences between the assumptions used relate to discount rates, mortality rates and expense assumptions. These differences are outlined in this section.

The following table summarises the Company's gross technical provisions split by Solvency II line of business. The Solvency II technical provisions are shown gross of reinsurance and include the impact of any transitional measures.

#	Line of Business As at 31 December 2016	Best Estimate Liability ("BEL") £m	Risk Margin £m	Solvency II technical provisions £m	IFRS technical provisions £m	Difference £m
32	Other life insurance	39,903	(106)	39,797	35,565	4,232
34	PPOs not health	60	3	63	54	9
D	Life insurance obligations	39,963	(103)	39,860	35,619	4,241
36	Life reinsurance	693	50	743	516	227
E	Life reinsurance obligations	693	50	743	516	227
	Total	40,656	(53)	40,603	36,135	4,468

Key areas of difference between the methods used to calculate Solvency II technical provisions and the methods used to calculate IFRS technical provisions are:

#### IFRS margins

Under IFRS, explicit margins for uncertainty are added to various best estimate assumptions including discount rates, mortality rates, expense assumptions and reinsurance counterparty default rates. Margins for uncertainty are not included in the Solvency II best estimate liability. This results in a decrease in Solvency II best estimate liabilities relative to IFRS technical provisions in respect of this adjustment.

#### Discount Rates

The Solvency II best estimate liability is valued using a risk-free rate curve with an allowance for credit risk and an MA.

Following guidance from the PRA, the Solvency II gross best estimate liabilities for reinsured business are discounted at a risk free rate. This increases gross best estimate liabilities, with an equal increase to the reinsurance asset, thus have no impact on best estimate liabilities net of reinsurance.

IFRS technical provisions are valued using a flat valuation interest rate which reflects the yields available on the underlying assets, with an allowance for credit risk based on internal analysis and an additional margin for adverse deviation. No distinction is made for reinsured business, with the consequent impact that IFRS gross technical provisions are lower than Solvency II gross best estimate liabilities.

### **Risk Margin**

In addition to the best estimate liability, Solvency II technical provisions include a risk margin. This is analogous to the additional margins held under IFRS to cover uncertainty.

### **D.2.5 Level of uncertainty in value**

Set out below are the main areas of uncertainty over the calculation of liabilities.

#### **Life Insurance Technical Provisions**

The best estimate liability corresponds to the probability-weighted average of future cash flows, taking account of the time value of money using the relevant risk-free interest rate term structure. They reflect estimates of how markets and the business might behave in the future given policyholder data, cash flow models and a set of assumptions.

All estimates are based on management's knowledge of current facts and circumstances; assumptions based on that knowledge; and their predictions of future events and actions. Actual results may differ from those estimates, possibly significantly. Fluctuation in the amount and/or timing of claims events is considered particularly susceptible to valuation uncertainty, e.g. when estimating the length of time for which an annuity will be paid which requires a projection of annuitant mortality rates in excess of 20 years into the future which cannot be done with certainty.

The best estimate liability assumptions are governed by a rigorous process, underpinned by actuarial judgement and peer review. The scope of assumption review papers includes considering the degree of uncertainty inherent in the assumptions being reviewed.

Data governance and model governance standards are in place, which help to ensure that the cash flow models used to calculate technical provisions, and the data which is used within that calculation, are fit for purpose and are managed under appropriate change control processes.

The cash flow projection models which are used to determine the best estimate liability are subject to a model base-lining exercise, which undertakes to reproduce the model's results from first principles, taking into account any information obtained from policy documents and operational procedures.

#### **Regulatory compliance**

The Company's insurance business is subject to dual local regulation, directly authorised by both the PRA (for prudential regulation) and the FCA (for conduct regulation). Between them, the PRA and FCA have broad powers including the authority to grant, vary the terms of, or cancel a regulated firm's authorisation; to investigate marketing and sales practices; and to require the maintenance of adequate financial resources.

The Company has compliance resources to respond to regulatory enquiries in a constructive way, and take corrective action when warranted. However, all regulated financial services companies face the risk that their regulator could find that they have failed to comply with applicable regulations or have not undertaken corrective action as required.

The impact of any such finding could have a negative impact on the Company's reported results.

## D.3 Other liabilities

Liabilities have been valued according to the requirements of the Solvency II directive and related guidance. The basis of the Solvency II valuation principle is the amount for which the liabilities could be transferred or settled between knowledgeable willing parties in an arm's length transaction.

A description of the basis of valuation under Solvency II along with valuation differences between the Solvency II bases and the IFRS financial statements, by liability class, is provided below.

### D.3.1 Deferred tax liabilities

Deferred tax for Solvency II valuation purposes is determined on a non-discounted basis in accordance with IAS 12 principles on 'temporary differences' between the economic value of assets or liabilities on the Solvency II balance sheet and their tax base. Deferred tax assets are recognised separately on the Solvency II balance sheet to the extent they cannot be offset against corresponding deferred tax liabilities. At 31 December 2016 the Company had no net deferred tax assets.

Deferred tax balances in the Solvency II balance sheet differ from those recognised in the IFRS balance sheet as a result of:

- Differences between the IFRS and Solvency II balance sheet valuation basis (as described in section D.1 and the remainder of section D.3) and consequential impact on recognition of deferred tax assets and liabilities, the largest impact being as a result of the revaluation of technical provisions; and
- IFRS assets and liabilities with an associated deferred tax balance treated as having no economic value under Solvency II.

### Unused tax losses and credits

The Company has no unrecognised tax losses at 31 December 2016.

### D.3.2 Derivatives

Under Solvency II, derivative liabilities are measured at fair value in accordance with IFRS, excluding any adjustments for changes in own credit standing of the Company since issuance. Fair values are obtained from quoted market prices, or if these are not available, by using valuation techniques such as discounted cash flow models or option pricing models. All derivatives are classified as assets when their fair values are positive and as liabilities when their fair values are negative.

### D.3.3 Financial liabilities (including borrowings, payables and subordinated liabilities)

Financial liabilities (including payables) consist of the following headings listed in the Solvency II balance sheet QRT:

- Debts owed to credit institutions
- Financial liabilities other than debts owed to credit institutions
- Insurance and intermediaries payables
- Payables (trade, not insurance)
- Subordinated liabilities

Deposits received from reinsurers are described in section D.3.4.

Each of these categories is valued according to the methodology described below.

Financial liabilities expected to be paid within one year are valued on the Solvency II and IFRS balance sheets at the amounts expected to be paid.

Under Solvency II, non-current financial liabilities are measured at fair value, adjusted to eliminate movements in fair value due to changes in the own credit standing of the Company. This is achieved by determining the timing and monetary amount of expected outflow of cash or other resources and discounting the projected cash flows using a current risk free rate adjusted for the credit spread at initial recognition of the liability. Under IFRS, non-current financial liabilities are either carried at amortised cost or fair value under the fair value option.

#### D.3.4 Deposits received from reinsurers and reinsurance payables

Deposits received from reinsurers represent funds withheld by the Company under the terms of a 22.5% Quota Share reinsurance arrangement entered into with the parent company, UKLAP, and 50% Quota Share reinsurance arrangement entered into with All. Further information on these arrangements is provided in section A.2.1 of this report and in note 34 of the Company's financial statements.

#### D.3.5 Contingent liabilities

Under Solvency II reporting, material contingent liabilities are required to be recognised in the balance sheet. The Company has no material contingent liabilities under Solvency II.

### D.4 Alternative methods of valuation

#### D.4.1 Company approach to valuation

The Company applies the Group Asset Valuation Business Standard to the valuation of its assets and liabilities. This sets out a control framework in respect of valuation, including assets and liabilities valued under alternative methods of valuation. This standard defines the following control objectives:

- **Primary valuation** – Parties responsible for primary valuations must ensure that appropriate valuation techniques are selected and justified.
- **Independent price verification** – A party independent of the primary valuation process must have sufficient controls in place to ensure valuations of all asset classes are reasonable. Controls should be commensurate with the materiality of the assets.
- **Valuation uncertainty** – The extent of uncertainty within valuations must be understood, quantified where possible and reported to senior management.
- **Reporting bases** – Where appropriate the valuation must be performed consistently across reporting bases. Where a consistent basis is not used, then a reconciliation of differences should be understood, documented and reported.
- **Client supplied prices** – Client supplied prices should be identified, and sufficient independent price verification ("IPV") controls exercised to provide assurance over the quality of the valuation.

#### D.4.2 Assets and liabilities to which an alternative valuation approach applies

For the financial year ending 2016, the following classes of assets and liabilities were subject to valuation under alternative valuation methods:

- Commercial mortgages and healthcare mortgages
- Equity release mortgages
- Project finance loans and infrastructure loans
- Privately placed debt securities
- Collateralised lending with banks

#### D.4.3 Justification for use of an alternative valuation approach

The majority of the Company's assets and liabilities are measured at fair value based on quoted market information or observable active market data. Where quoted market information or observable market data is not available, an alternative valuation method is used. This occurs when either:

- The individual nature of the asset means that there is no quoted price available (for example, commercial mortgages).
- The asset is not actively traded in a market (such as holdings in unlisted private placements).

Alternative valuation methods include the use of estimates and assumptions that are not market observable. Where estimates and assumptions are used by the Company in valuing its assets and liabilities, they are based on a combination of independent third-party evidence and internally developed models, calibrated to market observable data where possible.

#### **D.4.4 Assumptions underlying the valuation approach and assessment of valuation uncertainty**

The Company performs an annual exercise to assess valuation uncertainty across its investment portfolio. The main assumptions underlying the valuation approach and assessment of valuation uncertainty for the categories identified in section D.4.2 are described below.

##### **Commercial mortgages and healthcare mortgages (£9,694 million)**

The mortgages are valued using a model that calculates a credit risk adjusted value for each mortgage. The credit risk adjusted contractual future cash flows are calculated by stochastically forecasting how the future loan repayments are impacted by a large number of inputs. The key inputs feeding into the credit risk calculation are changes in property value, probability of tenant defaults, expected rental growth and property growth and likelihood of the borrower continuing to service the loan if the tenant defaults. The credit risk adjusted cash flows are then discounted at a risk free rate plus a liquidity premium calibrated to lending on new loans.

Valuation uncertainty arises from variation in the expected range of the key inputs feeding into the credit risk calculation and the liquidity premium. Valuation uncertainty has been assessed as moderate for this asset class.

##### **Equity release mortgages (£5,226 million)**

The equity release mortgages are valued using an Internal Model that calculates a credit risk adjusted value for the mortgages. Cash flows are adjusted for credit risk and discounted using a yield curve and global assumptions for the liquidity premium. The model derives a best estimate view on property growth and explicitly calculates the additional return that would be demanded by investors due to uncertainties in the asset cash flows.

Valuation uncertainty in the model primarily arises from uncertainty in the calculation of future house prices. This includes uncertainty relating to house price inflation, equity release price indices, residential property volatility, initial property valuations at loan inception and performance of individual properties relative to house price inflation. Valuation uncertainty has been assessed as significant for this asset class.

##### **PFI and infrastructure loans (£2,328 million)**

PFI and infrastructure loans are valued using either a model that calculates a credit risk adjusted value for each loan or using a discounted cash flow model, depending on the nature of the loan.

Loans valued using credit risk adjusted contractual future cash flows are calculated by stochastically forecasting how the future loan repayments are impacted by a large number of inputs. The key inputs feeding into the credit risk calculation are changes in property value, probability of tenant defaults, expected rental growth and property growth and likelihood of the borrower continuing to service the loan if the tenant defaults. The credit risk adjusted cash flows are then discounted at a risk free rate plus a liquidity premium calibrated to lending on new loans.

Loans valued using a discounted cash flow model add spreads for credit and illiquidity to a risk free discount rate. Credit spreads are updated quarterly using an internally developed methodology which depends on the credit rating of each loan, credit spreads on publicly traded bonds and an estimated recovery rate in event of default.

Valuation uncertainty arises from variation in the expected range of the key inputs feeding into the credit risk calculation and the liquidity premium. Valuation uncertainty has been assessed as moderate for this asset class.

##### **Privately placed debt securities (£1,864 million)**

Privately placed notes are valued using either broker quotes or a discounted cash flow model. The discounted cash flow model uses discount factors based on swap curves of similar maturity, plus internally derived spreads for credit risk. The spread added to the swap curve also includes an additional spread loading to reflect the illiquidity of the investment.

Valuation uncertainty arises on the private placement portfolio in the choice of spreads for credit and liquidity. Valuation uncertainty has been assessed as moderate for this asset class.

##### **Collateralised lending with banks (£553 million)**

Collateralised lending with banks comprises loans to banking counterparties that have been collateralised with illiquid securities. Fair values are calculated using valuation models which incorporate a number of assumptions, including probability of counterparty default and expected loss in the event of counterparty default. Expected loss in the event of counterparty default is driven by assumptions describing the expected liquidation period of the collateral, the volatility of the collateral during

this liquidation period and the extent to which the Company believes there is a correlation between the collateral value and counterparty default probability.

Valuation uncertainty arises from variation in the expected range of a number of the key assumptions described above. Valuation uncertainty has been assessed as moderate for this asset class.

#### **D.4.5 Adequacy of the valuation compared to experience**

The Company operates IPV controls across all assets. For asset types where a secondary source is available (such as OTC derivatives), this involves comparing the primary valuation to the secondary source, investigating material differences and making valuation adjustments where the Company believes it is appropriate to do so. For illiquid debt securities which are marked to model the IPV process includes a review of the valuation methodology, periodic assessment of both observable and judgemental model inputs as well as reviewing any secondary trading activity in the asset to understand whether anything can be learnt regarding the appropriateness of the valuation methodology.

For asset classes where a secondary source is not available and there is no secondary trading activity (such as investment property and private equity), the Company relies on the implementation of accepted valuation standards by parties independent of the Group as described above (e.g. valuation of investment property in line with the methodologies described in the RICS “red book”). These are asset classes with considerable valuation uncertainty and, to assess the reasonableness of the valuations, back testing analysis is performed on an annual basis for any assets sold during the year. Results of these back testing analyses are presented in the Company’s valuation uncertainty assessments.

# Section E

## Capital Management

### In this chapter

E.1 Own Funds

E.2 SCR and Minimum Capital Requirement (“MCR”)

E.3 Use of duration-based equity risk sub-module in the calculation of the SCR

E.4 Difference between the Standard Formula and Internal Model

E.5 Non-compliance with the MCR and non-compliance with the SCR

## Section E: Capital Management

This section of the report describes the internal operational structures and procedures underlying the Company's capital management process covering structure and quality of Own Funds; SCR and MCR; methodology for calculation of the SCR; differences between Internal Model and Standard Formula and any other material information.

### E.1 Own Funds

#### E.1.1 Management of Own Funds

The primary objective of capital management is to optimise the balance between return and risk, whilst maintaining economic and regulatory capital in accordance with risk appetite. In managing Own Funds, the Company seeks to:

- Match the profile of its assets and liabilities, taking account of the risks inherent in the business;
- Maintain sufficient, but not excessive, financial strength to support new business growth and satisfy the requirements of its policyholders and its regulator, the PRA;
- Retain financial flexibility by maintaining sufficient liquidity; and
- Allocate capital efficiently, applying it to support value adding growth and repatriating excess capital to the Group through dividends.

In order to achieve these objectives, Own Funds are monitored via projections over a three year planning horizon. The Company also uses a number of sensitivity tests to understand the volatility of earnings, the volatility of its capital requirements, and to manage its capital more efficiently. Sensitivities to economic and operating experience are regularly produced on the Company's key financial performance metrics to inform decision making and planning processes, and as part of the framework for identifying and quantifying the risks to which the Company is exposed.

For long-term business in particular, sensitivities of market consistent performance indicators to changes in both economic and non-economic experience are continually used to manage the business and to inform the decision making process.

There have been no material changes to the objectives, policies or processes with respect to the management of Own Funds during the year.

#### E.1.2 Own Funds by tier

The table below sets out the Company's Own Funds at 31 December 2016:

31 December 2016	Total £m	Tier 1 unrestricted £m	Tier 1 restricted £m	Tier 2 £m	Tier 3 £m
Ordinary share capital	908	908	-	-	-
Share premium account	1	1	-	-	-
Reconciliation reserve	1,199	1,199	-	-	-
Subordinated liabilities	206	-	206	-	-
<b>Total Basic Own Funds after adjustments</b>	<b>2,314</b>	<b>2,108</b>	<b>206</b>	-	-
Restrictions	-	-	-	-	-
<b>Total Eligible Own Funds to meet the SCR</b>	<b>2,314</b>	<b>2,108</b>	<b>206</b>	-	-
Restrictions to meet the MCR	-	-	-	-	-
<b>Total Eligible Own Funds to meet the MCR</b>	<b>2,314</b>	<b>2,108</b>	<b>206</b>	-	-

Further information on Own Funds by tier is presented in QRT S.23.01.01 'Own Funds'. The Company's capital consists of tier 1 unrestricted and tier 1 restricted capital.

Unrestricted tier 1 capital (£2,108 million) represents 91% of the Company's eligible Own Funds to meet the SCR. This consists of the ordinary share capital, share premium and reconciliation reserve. Ordinary share capital is classified as unrestricted as there are no restrictions on cancellation of the Company's dividends prior to payment, as set out in the Company's Articles of Association. Tier 1 unrestricted capital includes the highest quality assets with quality features such as permanence, subordination, undated, absence of redemption incentives, mandatory costs and encumbrances.

Restricted tier 1 capital (£206 million) consists of subordinated debt, qualifying under transitional provisions. Further information on transitional arrangements is provided in section E.1.3. Tier 1 restricted capital has the same quality features as Tier 1 unrestricted capital.

### E.1.3 Details of Own Funds in issue

#### E.1.3.1 Issued share capital and share premium as at 31 December 2016

The Company had an aggregate issued and outstanding ordinary share capital of £908 million and share premium of £1 million at 31 December 2016.

#### E.1.3.2 Subordinated liabilities in issue as at 31 December 2016

Under IFRS, subordinated debt is valued on an amortised cost basis. Under Solvency II, hybrid debt is valued on a fair value basis, with changes in own credit standing removed for subsequent measurement. A discounted cash flow approach has been used to assess the fair value and, for the purpose of the valuation, it is assumed that the option to redeem at the first call date will be exercised.

Capital Instrument, including nominal, coupon and extent of subordination	Issue date	Redemption date	Callable at par at option of the Company from	Solvency II Tier	Solvency II value 2016 £m
2.5068% £200m subordinated notes	8 Dec 2014	Undated	8 Dec 2019	Restricted Tier 1	206

### Transitional measures

The transitional measures prescribed under Solvency II allow the subordinated debt to concerned to count towards a firm's available Own Funds, subject to tiering limits, for a period of up to ten years after 1 January 2016. The Company's subordinated notes do not qualify directly as Solvency II Own Funds, but met the Solvency I requirements without reliance on waivers and are therefore eligible for Solvency II transitional treatment. The subordinated notes qualified as upper tier 2 capital under the previous Solvency I regime and are classed as restricted tier 1 capital under the Solvency II regime.

### E.1.4 Reconciliation reserve

The table below sets out the constituents of the reconciliation reserve:

	Total £m
<b>31 December 2016</b>	
<b>Solvency II excess of assets over liabilities</b>	2,108
Ordinary share capital	(908)
Share premium account	(1)
<b>Reconciliation reserve</b>	<b>1,199</b>

The reconciliation reserve equals the total excess of Solvency II assets over liabilities reduced by the Other Basic Own Funds items that have been separately identified on the Own Funds QRT being; share capital and share premium

### E.1.5 Differences between IFRS net assets and the excess of assets over liabilities as calculated for Solvency II

The table below lists the material differences between equity as shown in the financial statements of the Company and the excess of assets over liabilities as calculated under Solvency II.

31 December 2016	Total £m
<b>Total Company equity on an IFRS basis</b>	<b>1,752</b>
Liability valuation differences (net of transitional deductions)	(4,521)
Inclusion of risk margin (net of transitional deductions)	53
Reinsurance recoverable differences	4,902
Net deferred tax adjustments	(74)
Revaluation of loans and subordinated liabilities from amortised cost to fair value	10
Quota Share valuation adjustments	(14)
<b>Solvency II excess of assets over liabilities</b>	<b>2,108</b>

The increase in net assets of £356 million results from solvency valuation differences.

Technical provision valuation differences and the inclusion of the risk margin are described in section D.2.4.

Reinsurance recoverable valuation differences are described in section D.1.5.

Net deferred tax adjustments are described in section D.3.1.

Revaluation of loans is described in section D.1.3 and D.3.3.

Quota Share valuation adjustments are discussed in section D.3.4.

#### E.1.6 Restricted Own Funds items in respect of MA portfolios (unaudited)

The Company's MA portfolio does not have a surplus in excess of its SCR and, as a consequence, no restriction to Own Funds has been applied.

There are no other restrictions on Own Fund items.

## E.2 SCR and MCR

### E.2.1 SCR (unaudited)

The Company SCR at 31 December 2016 is £1,126 million.

The Company SCR is calculated entirely using an Internal Model. There are no parts of the Company valued using the Standard Formula.

A more detailed breakdown of the Company SCR by risk module is shown below, consistent with the annual S.25.03.21 QRT. Each risk module includes the impact of diversification within that module, and the diversification line includes diversification between risk modules. Other risks and adjustments include the loss absorbing capacity of technical provisions ("LACTP") and the loss absorbing capacity of deferred tax ("LACDT").

SCR by risk module (£m)	Total	Internal Model	Standard Formula
Market risk	920	920	-
Counterparty default risk	128	128	-
Life underwriting risk	1,068	1,068	-
Health underwriting risk	-	-	-
Non-life underwriting risk	-	-	-
Operational risk	51	51	-
Other risks and adjustments	(221)	(221)	-
<b>Total undiversified modules</b>	<b>1,946</b>	<b>1,946</b>	<b>-</b>
Diversification	(820)		
SCR excluding capital add-on	1,126		
Capital add-on already set	-		
<b>SCR</b>	<b>1,126</b>		

The Company's SCR has reduced during the year due chiefly to the changes in reinsurance arrangements with All described in section A.1.3, offset by the effects of adverse economic changes, particularly interest rate movements.

### **E.2.2 MCR**

The MCR represents the minimum level below which the amount of financial resources of a firm should not fall.

The MCR is calculated using a linear formula that applies prescribed factors to capital-at-risk and the best estimate liability (net of reinsurance). The MCR is subject to a floor, equal to 25% of the SCR, and a cap, equal to 45% of the SCR. There is an absolute floor of €3.7 million.

The MCR for the Company at 31 December 2016 is £282 million.

### **E.2.3 Transitional measures, disclosure of capital add-ons and USPs (unaudited)**

Regulators have the power to impose capital add-ons to the SCR or to require the use of certain USPs in the Standard Formula, where there are significant deficiencies in a firm's Internal Model or Partial Internal Model, or where a Standard Formula firm's risk profile deviates significantly from the assumptions underlying the Standard Formula.

In addition, regulators have the option to specify that any capital add-ons or the SCR impact of any required USPs do not need to be disclosed separately to the total SCR, during a transitional period. The PRA has chosen to exercise this option with a two-year transitional period.

## **E.3 Use of the duration-based equity risk sub-module in the calculation of the SCR**

The Company does not use the Standard Formula and therefore does not use the duration-based equity risk sub-module in the calculation of the SCR.

## **E.4 Differences between the Standard Formula and Internal Model (unaudited)**

### **E.4.1 Use of the Internal Model in the Company's business**

The Internal Model provides input to a number of key business processes and activities. Therefore the outputs from the Internal Model are used in day-to-day risk management and business decisions across the Company. "Use" does not imply that the Internal Model is used to directly run the business, but rather that the outputs of the Internal Model and the Internal Model itself are used to support decision-making, whilst acknowledging its limitations and balancing against other elements of the RMF.

The primary purpose of the Internal Model is to calculate the capital metrics required for regulatory reporting under Solvency II. The outputs of the Internal Model are used internally and externally in risk based performance reporting and risk and financial strength reporting to senior management and the Board.

The granular metrics produced by the Internal Model are also used to set strategy and support a series of other activities, including:

- Strategy and business planning: allocating capital between business areas to measure risk-adjusted return and set risk appetites as part of the business planning cycle;
- Pricing: improving pricing and product design by assessing the level of capital required to support different types of products and their inherent risks;
- Transactions: assessing the appropriateness of potential business investments through the impact on surplus capital;
- Reinsurance: identifying the need for targeted reinsurance contracts to mitigate undesirable risk exposures, through modelling potential adverse scenarios;
- Asset and liability management: measuring the impact of market changes on assets and liabilities to drive investment and hedging strategy.

Further details on how the Internal Model is fully integrated into the Company's risk management system are given in section B.3.3.

## E.4.2 Undertakings in scope of the Internal Model

The Group is a large multinational insurance organisation operating across a variety of business lines; this drives the risk profile and, by extension, the design and structure of the Internal Model. The Company, as part of the Group, makes use of the Group Internal Model, and all of its business is included within the scope of the Group Internal Model.

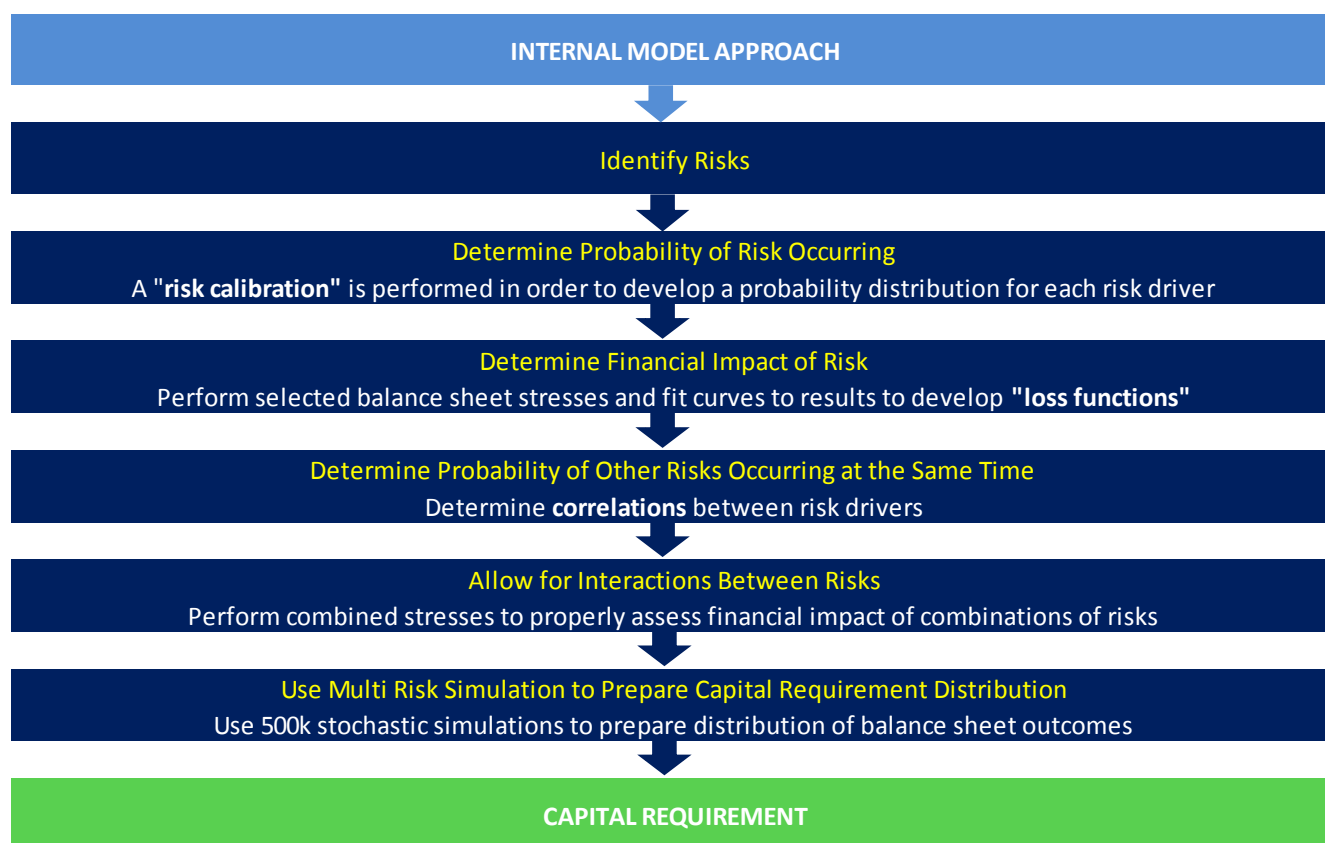

The Group Internal Model has been designed to allow each legal entity within the Group to run the business with a focus on risk. This means that the Internal Model has been designed to produce capital figures at a range of levels and granularities, from legal entity to fund level (and in some cases to a product or asset level), allowing for diversification between risk types at each of those levels. Producing and understanding the capital requirements at different levels of granularity is crucial to ensure that the model outputs can be effectively used in the day-to-day running of the business.

## E.4.3 Calculation of the Internal Model

### E.4.3.1 Methods used

The purpose of the Internal Model is to identify the risks to which the Company is exposed, model these risks using suitably calibrated inputs and aggregate them to compute the SCR. The Internal Model produces an aggregate distribution of the change in basic Own Funds over a one year time horizon from which the SCR can be directly derived (i.e. the SCR is the 99.5<sup>th</sup> percentile) in line with Article 101.

An overview of the Company's approach is shown below.

### Overview of the Company's modelling approach

The Company's Internal Model allows flexibility in determining which statistical distributions to use to represent risk factors (such as mortality, interest rates or credit risk) including those with heavy tails and empirical distributions. The model is not limited to assuming risks follow normal (or similar) distributions, as is implicit in the Standard Formula. This flexibility is important to ensure that the Company accurately models the behaviour of the risks which are most important risks to it.

For the majority of risk factors, standard statistical distributions fitted via the standard risk factor calibration process are used. However, for some risk types, such as credit risk or operational risk, distributions are derived from further modelling processes. This approach is appropriate given both the materiality of the risk types and the desire to ensure the risk's behaviour is accurately reflected.

A wide range of testing and review processes are used to ensure that the calibrations are appropriate, and the Internal Model outputs are reasonable. These range from bottom-up reviews of the material assumptions used in the modelling process and testing of the calibrations and loss functions (i.e. the mathematical formulae used as a proxy for the calculations in the asset and liability management models for the valuation of the assets and liabilities on the balance sheet), to top-down stress and scenario testing, as well as profit and loss attribution exercises.

Aviva has chosen to implement a Partial Internal Model Group wide, defined as using a combination of Internal Model and Standard Formula approaches to calculate solvency capital requirements for different components of the business. Within the Company, these components are distinct blocks of business, rather than risks. The Company SCR is calculated entirely using the Internal Model.

#### **E.4.3.2 Data used in the Internal Model**

The key data used in the Company's Internal Model is listed below:

- Accounting data (IFRS) – this is used in the valuation of certain liabilities;
- Policy data – this includes claims as well as policies in force and past policies;
- Operational risk data – an external database of information with regards to industry operational risk losses is used. This is provided by the Operational Risk Insurance Consortium ("ORIC");
- Financial market data – the calibration process for market and credit risks often uses external financial market asset data (e.g. FTSE index returns);
- Internal asset data – the valuation of the base Solvency II Balance Sheet relies on the market valuation of assets. The data used is largely taken from the accounting process and, therefore, most data will be included under the heading 'accounting data';
- Other data – data that does not fall under the above five categories.

The Solvency II Data Governance Group Business Standard establishes the control environment and the criteria to be used to assess the quality of the data in terms of appropriateness, completeness, accuracy, and consistency before using it for the SCR calculation.

#### **E.4.4 Differences between Standard Formula and Internal Model methodologies and underlying assumptions**

The main difference between the Standard Formula and Internal Model approach is that the methodology and assumptions used in the Internal Model are tailored to the Company's risk profile, whereas the Standard Formula uses a standardised approach.

The Internal Model reflects all material quantifiable risks to which the Company is exposed, whereas the Standard Formula only considers a subset of risks. Within the annual cycle, the Company reviews the risks that the business is exposed to, and identifies which of those risks are to be included in the Internal Model. The most material risk that is included in the Internal Model, but is not included in the Standard Formula, is the credit risk on sovereign bonds. Other key risks modelled are inflation and changes in equity and interest rate volatility. Other differences in risks modelled are described below.

##### **Market risks module**

- The Internal Model considers changes in market volatility, which are not explicitly modelled in the Standard Formula. Equity volatility risk is particularly important for modelling business with guarantees in the Company.
- The Internal Model includes credit risk on sovereign bonds, which is not currently modelled under Standard Formula. The Internal Model also explicitly considers default migration and spread risks including some allowance for diversification between various credit exposures.
- Interest rates are modelled using three principal components, not just the change in the level of interest rates as under the Standard Formula.
- The Internal Model explicitly models inflation risk which is not included in the Standard Formula.
- For equity risk, only exposure to asset price falls is reflected in the Standard Formula, whereas the Internal Model allows for the full distribution of equity returns which allows exposure to equity values rising or falling to be captured;
- Health business written within the Company is modelled separately.

### **Counterparty default module**

- The Standard Formula considers all counterparty default risk under one module, whereas the internal model allows for the type of the counterparty and the nature of the exposure.

### **Life Insurance module**

- The Standard Formula assumes standard portfolios, whereas the internal model calibrations are tailored to the Company's specific portfolios.

### **Operational Risk**

- The Internal Model models operational risks using a scenario based approach. The Standard Formula uses a formulaic approach.

The two bases also use a different treatment for loss absorbing capacity of technical provisions. Under the Internal Model net loss functions are used, whereas in the Standard Formula an adjustment is made to the gross SCR for the loss absorbing capacity of technical provisions. The calculation of loss absorbing capacity of tax also differs between the two approaches as this is specified by the SF calculation.

Another key difference is in the modelling approach used to aggregate the results. For the Internal Model, the Company determines an aggregate distribution of losses by combining marginal risk distributions for each risk using a Gaussian Copula and applying loss functions. The Standard Formula uses a hierarchical correlations approach, where explicit correlation matrices are used to combine sub-module losses within each risk module, and then to combine the calculated losses of the different risk modules.

A key feature of the Internal Model compared with the Standard Formula is that the Internal Model captures fat tailed risks and non-linear loss profiles. In addition the Internal Model calculates the diversification benefit more granularly and, in particular, captures important features such as geographical diversification.

## **E.5 Non-compliance with the MCR and non-compliance with the SCR (unaudited)**

The Company did not fail to comply with the MCR or SCR at any time during 2016.

## F.2 Glossary

### Product definitions

<b>Annuity</b>	A type of policy that pays out regular amounts, either immediately and for the remainder of a person's lifetime, or deferred to commence from a future date. Immediate annuities may be purchased for an individual and his or her dependants or on a bulk purchase basis for groups of people. Deferred annuities are accumulation contracts, which may be used to provide benefits in retirement and may be funded by a policyholder by payment of a series of contributions or by a capital sum. Annuities may be guaranteed, unit-linked or index-linked.
<b>Bonds and savings</b>	These are accumulation products with single or regular premiums and unit-linked or guaranteed investment returns.
<b>Collective investment schemes (SICAVs)</b>	This is an open-ended investment fund, structured as a legally independent joint stock company, whose units are issued in the form of shares.
<b>Equity release</b>	Equity release mortgages allow a homeowner to receive a lump sum in return for a mortgage secured on their house. No interest is payable on the loan; instead, interest is rolled-up on the loan and the loan and accrued interest are repayable at redemption (upon death or moving into long-term care).
<b>Individual savings accounts (ISAs)</b>	Tax-efficient plans within the UK for investing in stocks and shares, cash deposits or life insurance investment funds, subject to certain limits.
<b>Investment sales</b>	Comprise retail sales of mutual fund-type products such as unit trusts, individual savings accounts (ISAs) and open ended investment companies (OEICs).
<b>Mortgage life insurance</b>	A protection contract designed to pay off the outstanding amount of a mortgage or loan in the event of the death of the insured.
<b>Non-profit</b>	Insurance cover guaranteeing certain benefits but for which the policyholder bears no investment risk and does not gain or lose if returns differ from expectations. Pure risk business, such as term assurance, annuities, health insurance and disability cover, is normally written on a non-profit basis.
<b>Pension</b>	A means of providing income in retirement for an individual and possibly his/her dependants.
<b>Personal pension</b>	A pension plan tailored to the individual policyholder, which includes the options to stop, start or change their payments.
<b>Regular premium</b>	A series of payments are made by the policyholder, typically monthly or annually for part of or all of the duration of the contract.
<b>Single premium</b>	A single lump sum is paid by the policyholder at the start of the contract.
<b>Stakeholder pensions</b>	Low cost and flexible pension plans governed by specific regulations

### General terms

<b>99.5% percentile</b>	An event that would be expected to occur once on every 200 years.
<b>Alternative valuation methods</b>	Valuation methods that are consistent with Article 75 of the SII Directive other than those which solely use the quoted market prices for the same or similar assets or liabilities.
<b>Basis risk</b>	The risk resulting from the situation in which the exposure covered by the risk-mitigation technique does not correspond to the risk exposure of the insurance or reinsurance undertaking.

<b>Best estimate liabilities (BEL)</b>	The expected present value of future cash flows for a company's current insurance obligations, calculated using best estimate assumptions, projected over the contract's run-off period, taking into account all up-to-date financial market and actuarial information.
<b>Concentration risk</b>	All risk exposures with a loss potential which is large enough to threaten the solvency or the financial position of insurance and reinsurance undertakings.
<b>Credit risk</b>	The risk of loss or of adverse change in the financial situation, resulting from fluctuations in the credit standing of issuers of securities, counterparties and any debtors to which insurance and reinsurance undertakings are exposed, in the form of counterparty default risk, spread risk or market risk concentrations.
<b>Diversification benefit</b>	The reduction in the risk exposure of insurance and reinsurance undertakings and groups related to the diversification of their business, resulting from the fact that the adverse outcome from another risk, where those risks are not fully correlated.
<b>Fair value</b>	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date (i.e. an exit price).
<b>Financial Conduct Authority (FCA)</b>	The FCA is an independent public body and is independent of the Bank of England. It is responsible for the conduct business regulation of financial services firms (including those firms subject to prudential regulation by the PRA) and the prudential regulation of firms not regulated by the PRA. The FCA has three statutory objectives: securing an appropriate degree of protection for consumers, protecting and enhancing the integrity of the UK financial system and promoting effective competition in the interests of consumers.
<b>International financial reporting standards (IFRS)</b>	These are international accounting regulations that all publicly listed companies in the European Union are required to use.
<b>Life business</b>	Businesses selling life and pensions contracts.
<b>Liquidity premium</b>	An addition to the risk-free rate used when projecting investment returns and discounting cash flows on certain types of contracts where the liabilities are illiquid and have cash flows that are predictable.
<b>Liquidity risk</b>	The risk that insurance and reinsurance undertakings are unable to realise investments and other assets in order to settle their financial obligations when they fall due.
<b>Longevity risk</b>	Risk associated with increasing life expectancy trends among policyholders and pensioners.
<b>Look through</b>	The Company considers the risks, assets, liabilities of its subsidiary as if they were its own.
<b>Market risk</b>	The risk of loss or of adverse change in the financial situation resulting, directly or indirectly, from fluctuations in the level and in the volatility of market prices of assets, liabilities and financial instruments.
<b>Matching adjustment (MA)</b>	An increase applied to the risk-free rate used to value insurance liabilities where the cash flows are relatively fixed (e.g. no future premiums or surrender risk) and are well matched to assets that are intended to be held to maturity and have cash flows that are also relatively fixed.
<b>Minimum capital requirement (MCR)</b>	The Minimum Capital Requirement is the minimum amount of capital that an insurer needs to hold to cover its risks under the Solvency II regulatory framework. If an insurer's capital falls below the MCR then authorisation will be withdrawn by the regulator unless a firm is able to meet the MCR within a short period of time.
<b>Mortality</b>	Rate of death, varying by such parameters as age, gender and health, used in pricing and calculating liabilities for policyholders of life and annuity products which contain mortality risks.
<b>Net written premiums</b>	Total gross written premiums for the given period, minus premiums paid over or 'ceded' to reinsurers.

<b>Operating expenses</b>	The day-to-day expenses involved in running the business including the staff costs. For the avoidance of doubt, operating expenses excludes commission, non-operating integration and restructuring costs, and amortisation and impairment of AVIF and intangible assets.
<b>Operating profit</b>	This is a non-GAAP financial performance measure. It is based on expected investment returns and stated before tax and before non-operating items including impairment of goodwill and amortisation and impairment of acquired value of in-force business, the profit or loss on disposal and remeasurement of subsidiaries and other items.
<b>Operational risk</b>	The risk of loss arising from inadequate or failed internal processes, personnel or systems, or from external events.
<b>Outsourcing</b>	An arrangement of any form between an insurance or reinsurance undertaking and a service provider, whether a supervised entity or not, by which that service provider performs a process, a service or an activity, whether directly or by sub-outsourcing, which would otherwise be performed by the insurance or reinsurance undertaking itself.
<b>Own Funds</b>	Under Solvency II, capital available to cover the SCR and MCR is referred to as Own Funds. This includes the excess of assets over liabilities in the Solvency II balance sheet (calculated on best estimate, market consistent assumptions and net of transitional measures on technical provisions), subordinated liabilities that qualify as capital under Solvency II, and off-balance sheet Own Funds approved by the regulator. Own Funds eligible to cover the SCR and MCR also reflect any tiering restrictions.
<b>Persistency</b>	The rate at which policies are retained over time and therefore continue to contribute to premium income and funds under management.
<b>Prudential Regulation Authority (PRA)</b>	<p>The PRA is a part of the Bank of England and is responsible for the prudential regulation of deposit taking institutions, insurers and major investment firms. The PRA has three statutory objectives:</p> <ul style="list-style-type: none"> <li>• A general objective to promote the safety and soundness of the firms it regulates</li> <li>• An objective specific to insurance firms, to contribute to the securing of an appropriate degree of protection for those who are or may become insurance policyholders; and</li> <li>• A secondary objective to facilitate effective competition.</li> </ul>
<b>Qualifying holding</b>	A direct or indirect holding in an undertaking which represents 10% or more of the capital or of the voting rights or which makes it possible to exercise a significant influence over the management of that undertaking.
<b>Required capital</b>	The amount of assets, over and above the value placed on liabilities in respect of covered business, whose distribution to shareholders is restricted.
<b>Risk-adjusted returns</b>	Adjusting profits earned and investment returns by how much risk is involved in producing that return or profit
<b>Risk margin</b>	The amount an insurance company would require, in excess of best estimate liabilities, in order to take over and meet the whole portfolio of insurance and reinsurance obligations. It reflects the cost of providing capital equal to the Solvency II capital requirement for non-hedgeable risks necessary to support the insurance obligations over their lifetime. Risk margin represents the value of deviation risk of the actual outcome compared with the best estimate, expressed in terms of a defined risk measure.
<b>Solvency II</b>	These are insurance regulations designed to harmonise EU insurance regulation. Primarily this concerns the amount of capital that European insurance companies must hold under a measure of capital and risk. Solvency II became effective from 1 January 2016.
<b>Solvency II cover ratio</b>	Own Funds divided by the Solvency Capital Requirement.
<b>Solvency II surplus</b>	Own Funds less the Solvency Capital Requirement.

<b>Solvency Capital Requirement (SCR)</b>	The Solvency Capital Requirement is the amount of capital the regulator requires an insurer to hold to meet the requirements under the Solvency II regulatory framework. Holding capital in excess of the SCR demonstrates an insurer has adequate financial resources in place to meet all its liabilities as and when they fall due and that there is sufficient capital to absorb significant losses. Firms may use their own Internal Model, the European Insurance and Occupational Pensions Authority (EIOPA) prescribed Standard Formula or a partial Internal Model to determine SCR.
<b>Special Purpose Vehicle</b>	Any undertaking, whether incorporated or not, other than an existing or insurance or reinsurance undertaking, which assumes risks from insurance or reinsurance undertakings and which fully funds its exposure to such risks through the proceeds of a debt issuance or any other financing mechanism where the repayment rights of the providers of such debt or financing mechanism are subordinated to the reinsurance obligations of such an undertaking.
<b>Transitional measures on technical provisions (TMTP)</b>	TMTP is an adjustment to Solvency II technical provisions to bring them into line with the pre-Solvency II equivalent as at 1 January 2016 when the regulatory basis changed, to smooth the introduction of the new regime. This will decrease linearly over the 16 years following Solvency II implementation but may be recalculated to allow for material changes to the risk profile of the relevant business, subject to agreement with the regulator. TMTP may also be recalculated every 24 months at the request of either the firm or the regulator.
<b>Underwriting risk</b>	The risk of loss or of adverse change in the value of insurance liabilities, due to inadequate pricing and provisioning assumptions.
<b>UK Corporate Governance Code</b>	The code sets out guidance in the form of principles and provisions on how companies should be directed and controlled to follow good governance practice.
<b>Volatility adjustment</b>	A reduction to technical provisions to reflect temporary distortions in spreads caused by illiquidity in the market or extreme widening of credit spreads. The volatility adjustment reduces technical provisions by increasing the discount rate used to calculate the best estimate liability. Volatility adjustments are prescribed by EIOPA on a currency and country basis.

### F.3 Additional information on related undertakings

The following table is a complete list of the Company's related undertakings as at 31 December 2016 and includes information in relation to the % ownership, class of shares held and country of incorporation of each related undertaking.

<b>Subsidiary or related undertaking</b>	<b>% Ownership</b>	<b>Share class</b>	<b>Country of incorporation</b>
Aviva ERFA 15 UK Limited	100	Ordinary	United Kingdom

Synergy Sunrise (Bowthorpe) Limited	100	Ordinary	United Kingdom
Synergy Sunrise (Sentinel House) Limited	100	Ordinary	United Kingdom
Synergy Sunrise (Yorkshire House) Limited	100	Ordinary	United Kingdom

## F.4 Approvals and determinations

The following approvals, determinations and modifications apply for the Company at 31 December 2016:

### F.4.1 Approvals

Approval	Further information	PRA reference
Matching adjustment in the calculation of technical provisions		2198018
Volatility adjustment in the calculation of technical provisions		2200390
Transitional measures on technical provisions	30 June 2016 reset	2816448
Partial internal model in the calculation of the SCR	5 December 2015 1 March 2016: Approval of the partial internal model integration technique 23 March 2017: Non-significant changes to the partial internal model	5 December 2015: 2243951 1 March 2016: 2429709 23 March 2017: 4105642

In the Company, there are no ancillary own funds, 'non-standard' items in own funds, use of transitional measure on the risk-free interest rate, application of the duration-based equity risk sub-module for standard formula operations or application of undertaking specific parameters for standard formula operations.

### F.4.2 Determinations

There are no determinations.

### F.4.3 Modifications

There are no modifications. No permission has been sought for the no-disclosure of information in the SFCR.

## F.5 Directors' statement

We acknowledge our responsibility for preparing the Solvency and Financial Condition Report of Aviva Annuity UK Limited at 31 December 2016 in all material respects in accordance with the PRA Rules, the Solvency II Regulations, and the approvals, determinations and modifications in section F.4.

The Board is satisfied that to the best of its knowledge and belief:

- a) throughout the financial year to 31 December 2016, the Company has complied in all material respects with the requirements of the PRA Rules and the Solvency II Regulations as applicable to the Company, and with the approvals, determinations and modifications set out in section F.4; and
- b) it is reasonable to believe that in respect of the period from 31 December 2016 to the date of the publication of the SFCR, the Company has continued so to comply and that it will continue so to comply for the remainder of the financial year to 31 December 2017.

---

J M Windsor

Director

17 May 2017

## F.6 Audit opinion

**Report of the external independent auditors to the Directors of Aviva Annuity UK Limited ('the Company') pursuant to Rule 4.1 (2) of the External Audit Part of the PRA Rulebook applicable to Solvency II firms**

### **Report on the Audit of the relevant elements of the Solvency and Financial Condition Report**

#### **Opinion**

Except as stated below, we have audited the following documents prepared by the Company as at 31 December 2016:

- The 'Valuation for solvency purposes' and 'Capital Management' sections of the Solvency and Financial Condition Report of the Company as at 31 December 2016, (**'the Narrative Disclosures subject to audit'**); and
- Company templates S.02.01.02, S.12.01.02, S.22.01.21, S.23.01.01 and S.28.01.01 (**'the Templates subject to audit'**).

The Narrative Disclosures subject to audit and the Templates subject to audit are collectively referred to as the **'relevant elements of the Solvency and Financial Condition Report'**.

We are not required to audit, nor have we audited, and as a consequence do not express an opinion on the **Other Information** which comprises:

- Information contained within the relevant elements of the Solvency and Financial Condition Report set out above which are, or derive from the Solvency Capital Requirement, as identified in the Appendix to this report;
- The 'Executive summary', 'Business and performance', 'System of governance' and 'Risk profile' elements of the Solvency and Financial Condition Report;
- Company templates S05.01.02, S05.02.01 and S.25.02.21;
- Information calculated in accordance with the previous regime used in the calculation of the transitional measure on technical provisions, and as a consequence all information relating to the transitional measure on technical provisions as set out in the Appendix to this report;
- The written acknowledgement by management of their responsibilities, including for the preparation of the Solvency and Financial Condition Report (**'the Responsibility Statement'**).

To the extent the information subject to audit in the relevant elements of the Solvency and Financial Condition Report includes amounts that are totals, sub-totals or calculations derived from the Other Information, we have relied without verification on the Other Information.

In our opinion, the information subject to audit in the relevant elements of the Solvency and Financial Condition Report of the Company as at 31 December 2016 is prepared, in all material respects, in accordance with the financial reporting provisions of the PRA Rules and Solvency II regulations on which they are based, as supplemented by supervisory approvals.

## **Basis for opinion**

We conducted our audit in accordance with International Standards on Auditing (UK and Ireland) (ISAs (UK & I)), International Standard on Auditing (UK) 800 and International Standard on Auditing (UK) 805, and applicable law. Our responsibilities under those standards are further described in the *Auditors' Responsibilities for the Audit of the relevant elements of the Solvency and Financial Condition Report* section of our report.

## **Emphasis of Matter - Basis of Accounting**

We draw attention to the 'Valuation for solvency purposes' and 'Capital Management' sections of the Solvency and Financial Condition Report, which describe the basis of accounting. The Solvency and Financial Condition Report is prepared in compliance with the financial reporting provisions of the PRA Rules and Solvency II regulations, and therefore in accordance with a special purpose financial reporting framework. The Solvency and Financial Condition Report is required to be published, and intended users include but are not limited to the Prudential Regulation Authority. As a result, the Solvency and Financial Condition Report may not be suitable for another purpose. Our opinion is not modified in respect of this matter.

## **Responsibilities of Directors for the Solvency and Financial Condition Report**

The Directors are responsible for the preparation of the Solvency and Financial Condition Report in accordance with the financial reporting provisions of the PRA rules and Solvency II regulations, which have been supplemented by the approvals made by the PRA under the PRA Rules and Solvency II regulations on which they are based, as detailed in Section F.4 of the Solvency and Financial Condition Report.

The Directors are also responsible for such internal control as they determine is necessary to enable the preparation of a Solvency and Financial Condition Report that is free from material misstatement, whether due to fraud or error.

## **Auditors' Responsibilities for the Audit of the relevant elements of the Solvency and Financial Condition Report**

It is our responsibility to form an independent opinion, in accordance with applicable law, ISAs (UK & I) and ISAs (UK) 800 and 805 as to whether the information subject to audit in the relevant elements of the Solvency and Financial Condition Report is prepared, in all material respects, in accordance with the financial reporting provisions of the PRA Rules and Solvency II regulations on which they are based. ISAs (UK & I) require us to comply with the Auditing Practices Board's Ethical Standard for Auditors.

An audit involves obtaining evidence about the amounts and disclosures in the relevant elements of the Solvency and Financial Condition Report sufficient to give reasonable assurance that the relevant elements of the Solvency and Financial Condition Report are free from material misstatement, whether caused by fraud or error. This includes an assessment of: whether the accounting policies are appropriate to the Company's circumstances and have been consistently applied and adequately disclosed; the reasonableness of significant accounting estimates made by the Directors; and the overall presentation of the relevant elements of the Solvency and Financial Condition Report. In addition, we read all the financial and non-financial information in the Solvency and Financial Condition Report to identify material inconsistencies with the audited relevant elements of the Solvency and Financial Condition Report. If we become aware of any apparent material misstatements or inconsistencies we consider the implications for our report.

This report, including the opinion, has been prepared for the Directors of the Company to comply with their obligations under External Audit rule 2.1 of the Solvency II firms Sector of the PRA Rulebook and for no other purpose. We do not, in providing this report, accept or assume responsibility for any other purpose save where expressly agreed by our prior consent in writing.

## **Other Matter**

The Company has authority to calculate its Solvency Capital Requirement using an internal model ('the Model') approved by the Prudential Regulation Authority in accordance with the Solvency II Regulations. In forming our opinion (and in accordance with PRA Rules), we are not required to audit the inputs to, design of, operating effectiveness of and outputs from the Model, or whether the Model is being applied in accordance with the Company's application or approval order.

## Report on Other Legal and Regulatory Requirements

In accordance with Rule 4.1 (3) of the External Audit Part of the PRA Rulebook for Solvency II firms we are required to read the Other Information and consider whether it is materially inconsistent with the relevant elements of the Solvency and Financial Condition Report and our knowledge obtained in the audits of the Solvency and Financial Condition Report and of the Company's statutory financial statements. If, based on the work we have performed, we conclude that there is a material misstatement of this other information, we are required to report that fact. We have nothing to report in this regard.
