Whitepaper | August 2024

An unbiased approach to unlocking potential opportunities in emerging market debt

Barney Goodchild and Aaron Grehan

It takes Aviva Investors

Barney Goodchild
Head of Credit and Equity Investment Specialists

Main responsibilities

Barney leads the credit and equity investment specialists team. The team works closely with portfolio managers across our credit and equity platform to articulate their investment process, portfolio positioning and investment performance to clients and consultants around the world.

Aaron Grehan
Head of Hard Currency Emerging-Market Debt

Main responsibilities

Aaron is Head of Hard Currency Emerging-market Debt and a senior portfolio manager with co-management responsibility for both hard-currency sovereign and corporate bond portfolios. He has been co-managing the hard currency strategy since he joined the team in 2010 and has co-managed the corporate focused strategy since launch in 2012.

Key takeaways

Many EMD managers underperform during periods of market weakness due to a bias towards higher-yielding parts of the market, poor understanding of EM-specific risks and deficient portfolio construction.

Such approaches are likely to lead to higher drawdowns and increased volatility of excess returns over the long run.

Our differentiated approach seeks to avoid such biases and deliver alpha that is uncorrelated to HY and IG spread differentials, along with enhanced capital preservation and a smoother path of returns.

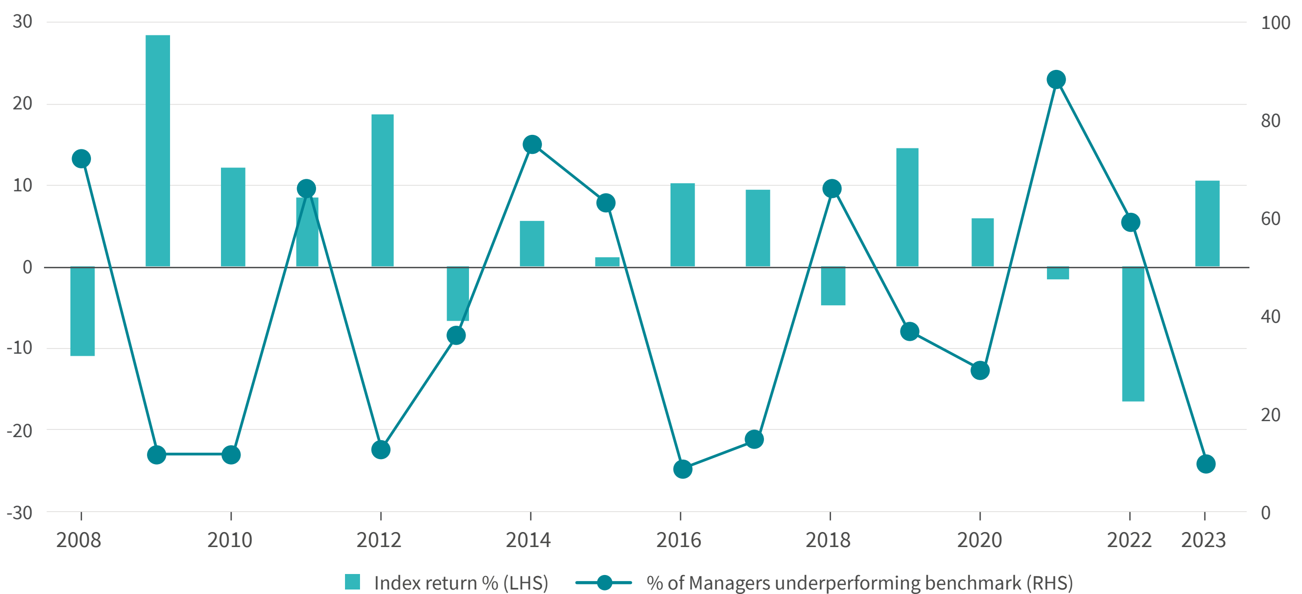
Introduction

An unbiased and flexible approach, deep understanding of risk and robust portfolio construction are the keys to delivering consistent outperformance in emerging-market debt (EMD) strategies.

EMD can offer significant returns, but has historically been susceptible to periods of increased volatility and rapid spread widening, as recently witnessed in 2021 and 2022 when global inflation concerns and the Russian invasion of Ukraine led to negative returns across EMD.

As shown below, when the JP Morgan EMBI Global index declined 1.51 per cent in 2021, 88 per cent of managers underperformed. Similarly, when the index fell 16.45 per cent in 2022, 60 per cent of managers underperformed.

Figure 1. **Index returns versus peer group performance (per cent)**



Note: Index returns: JP Morgan EMBI Global Index. Peers are from the eVestment Global Emerging-markets Hard Currency benchmarked to the EMBI Global or Global Diversified Index. Chart does not depict the performance of any Aviva product or strategy.
Source: Aviva Investors, eVestment. Data as of 9 August 2024.

An analogous pattern emerges when we look at drawdowns. In one of the most turbulent months during the Global Financial Crisis, October 2008, the index fell 14.9 per cent and 82 per cent of managers underperformed. More recently, 94 per cent of managers underperformed when the benchmark declined 12.6 per cent in March 2020, as the economic impact of strict lockdown measures at the onset of COVID-19 became clear.

There are three main reasons many managers fail to outperform during periods of market weakness

We believe there are three main reasons many managers fail to outperform during periods of market weakness:

1. A structural bias towards the higher-yielding parts of the EMD market.
2. A poor understanding of EM-specific risk factors and overreliance on traditional risk metrics.
3. Deficiencies in portfolio construction that lead to concentrated portfolios and overreliance on credit spread compression.

A failure to fully consider these factors is likely to lead to higher drawdowns and increased volatility of excess returns over the long run.

In this whitepaper, we examine the key elements of our approach to investing in EMD, which we believe are crucial to delivering superior outcomes for clients. These include uncorrelated alpha, a smoother return path and robust portfolio construction.

Aviva Investors Emerging-markets Hard Currency Strategy

Aviva Investors' Emerging-markets Hard Currency strategy is designed to generate alpha in both spread widening and tightening cycles aiming to deliver consistent outperformance thereby allowing for a structural allocation to the asset class.

A differentiated approach

Emerging-markets are typically less efficient than their developed-market counterparts. In our view, alpha opportunities are created by the breadth and diversity of an under-researched and under-reported universe. Our approach to generating consistent outperformance is underpinned by three core pillars, detailed below.

> Emerging-markets are typically less efficient than their developed-market counterparts

1. Unbiased, flexible process to generate uncorrelated alpha

The EM hard-currency debt universe is split approximately 60/40 between investment-grade and high-yield issuers. Our analysis of the EMD hard-currency peer universe suggests most managers have a structural bias towards higher-yielding parts of the market.

Whilst this can be profitable at certain points in the cycle, over the long run it is likely to lead to higher drawdowns and increased volatility of returns. Periods like Q4 2021, when 95 per cent of managers underperformed, and Q2 2022, when 82 per cent of managers underperformed, are examples of when a high-beta approach can be costly.

We take a different approach. We believe attractive investment opportunities exist across the investable universe, not only within the higher-yielding parts of the market. Our approach considers the full opportunity set without bias, resulting in flexible positioning between the high-yield and investment-grade portions of the market.

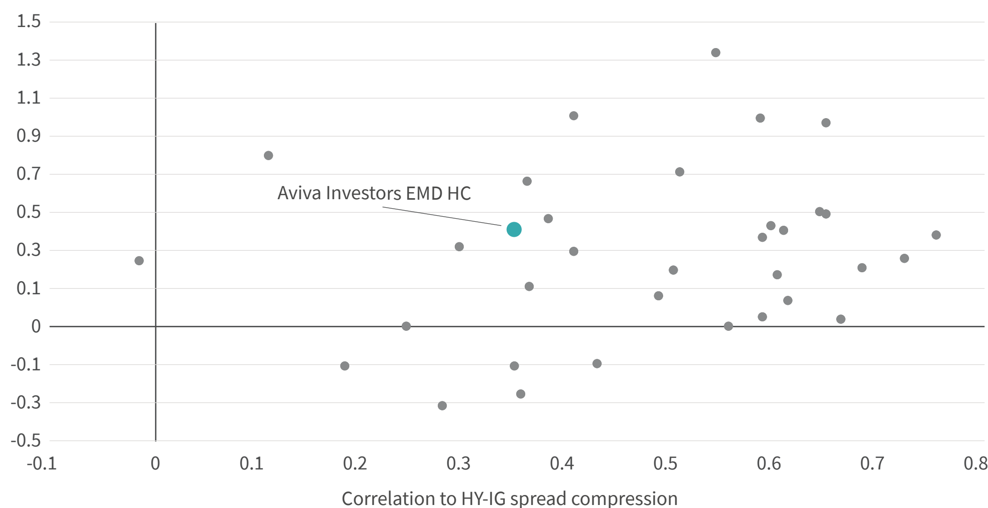
Ultimately, our ability to generate alpha is less dependent on high-yield spread compression. We generate alpha from active country selection decisions, not broad-based beta allocations.

> Ultimately, our ability to generate alpha is less dependent on high-yield spread compression

The result: alpha generation that has historically been uncorrelated to spread differentials between high yield and investment grade.

Figure 2. **Uncorrelated alpha**

Excess returns per cent annualised



Most hard currency managers generate their excess returns from a structural overweight to high-yield names

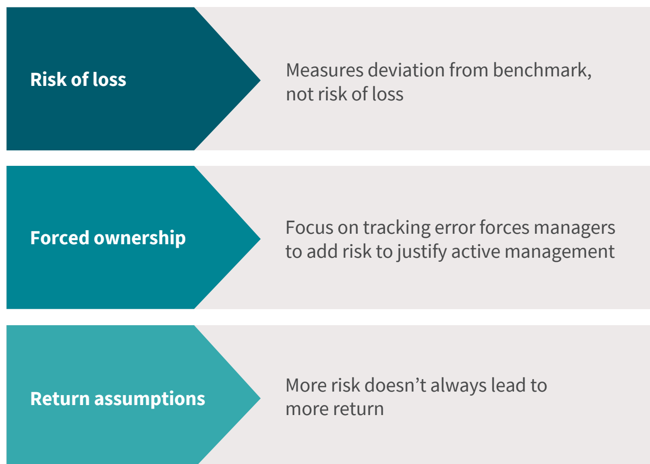
Our alpha generation is uncorrelated to high-yield – investment-grade spread differentials

Past performance is not a guide to future performance

Peers are those strategies in the Global Emerging Markets Fixed Income Hard Currency universe with returns from 2010-2021, preferred benchmark listed as either the JPM EMBI Global or JPM EMBI Global Diversified and base currency listed as USD. Calculations based on the spread of the JP Morgan EMBI Global Index, Investment Grade and High Yield indices.

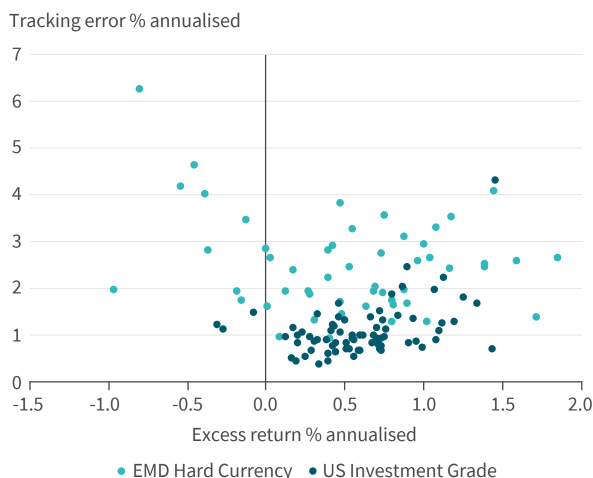
Figure 3. **Deep understanding of EM risk**

Limitations of tracking error



More risk does not always lead to more return

Tracking error vs excess return of EMD Hard Currency Managers and US IG Managers



Past performance is not a guide to future performance

Source: Aviva Investors, eVestment as at 31 March 2024. EM Hard Currency peers shown are the managers in the eVestment Global Emerging Markets Fixed Income – Hard Currency Universe with 10 years of monthly returns and whose stated benchmark is either the JPM EMBI Global or the JPM EMBI Global Diversified Index. US Investment Grade peers shown are the managers in the eVestment US Corporate Fixed Income Universe with 10 years of monthly returns and whose stated benchmark is the Bloomberg US Credit Index.

2. Deep understanding of EMD risk fosters capital preservation and smooth return path

As an asset class, EMD offers potentially attractive returns; however, different markets can exhibit periods of high volatility and idiosyncratic risk that are difficult to capture within traditional risk measures.

Tracking error is one such example. The measure is widely used by portfolio managers to understand levels of risk within a portfolio. However, it has several serious limitations we believe make it a poor risk metric:

- **Fails to measure risk of loss:** Tracking error measures the deviation from a benchmark rather than the risk of loss. If a benchmark index is inefficient, deviations from the benchmark should be beneficial in reducing risk or improving portfolio returns. Too often, however, deviation from a benchmark is viewed as "taking risk" rather than reducing it or improving risk-adjusted returns.
- **Engenders forced ownership:** Investment managers and consultants often focus on tracking error as a measure of the degree to which a portfolio is active. Strategies with low historical levels of tracking error are often labeled as "closet trackers" or "semi-passive". This forces managers to add risk or off-benchmark positions to appear active.
- **Incorrectly assumes more risk leads to excess returns:** In some asset classes, such as US investment-grade credit, a strong correlation exists between tracking error and excess returns. This suggests adding risk on average improves returns. Our analysis, however, indicates there is no correlation between tracking error and excess returns for EMD hard-currency managers. This is likely to be the result of higher downside risks.

We focus on a variety of risk measures, such as duration times spread, alongside a deep understanding of EM-specific risks built over decades of experience. Our process is not predicated upon a foundation of imperfect metrics. We believe this is a critical differentiating factor in our ability to deliver superior client outcomes. It is also important to consider non-financial risks, such as environmental, social and governance factors. These can highlight risks and opportunities that would not be captured by quantitative risk metrics or traditional fundamental analysis.

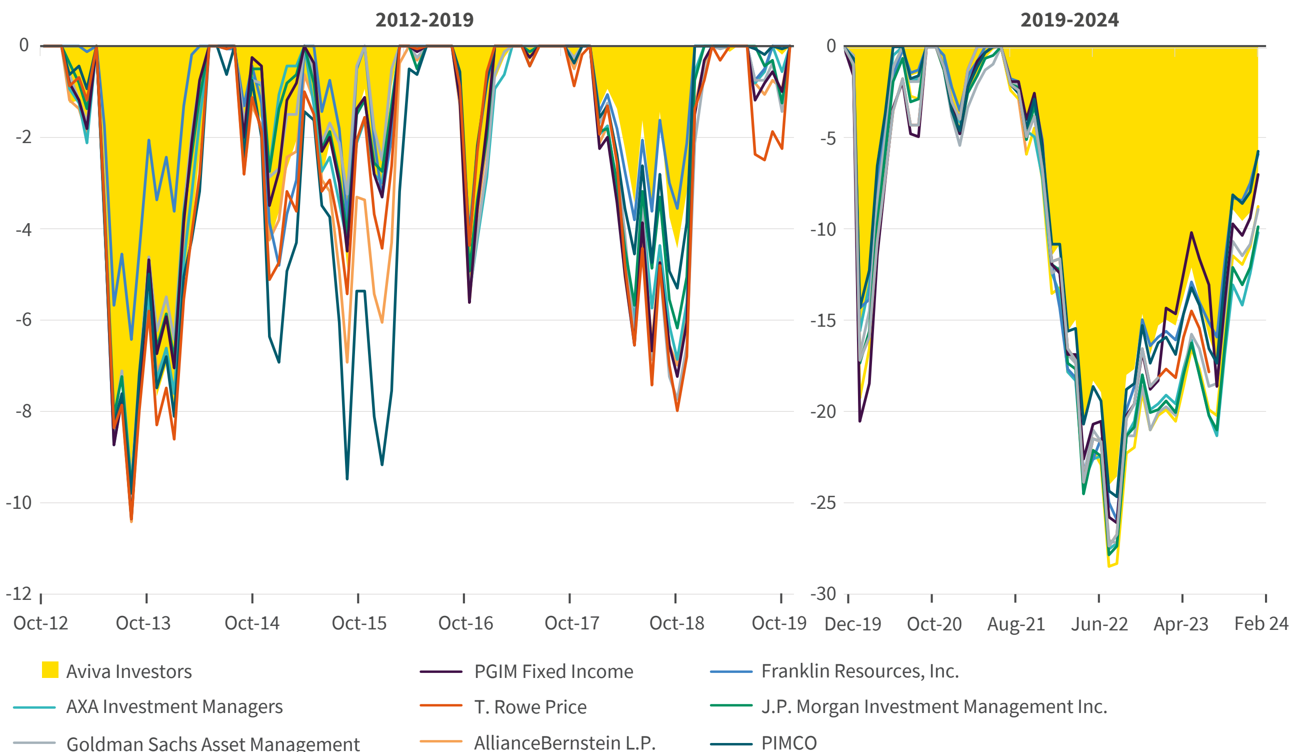
We focus on a variety of risk measures, such as duration times spread, alongside a deep understanding of EM-specific risks built over decades of experience

An in-depth understanding of EM risk is embedded throughout our investment process, which is centered around fundamental analysis. Through this, we believe we can thoroughly assess an issuer's risks to determine if we will be compensated accordingly.

We draw on a blend of quantitative and qualitative analysis to assess an issuer's ability and willingness to repay debt, its vulnerability to external shocks, and the ability of the authorities to take appropriate action if required.

The potential result: enhanced capital preservation and a smoother path of returns versus peers and the benchmark.

Figure 4. **Consistently low drawdowns**



Past performance is not a guide to future performance

Source: eVestment as at 31 March 2024. Aviva Investors Emerging Market Bond USD Composite shown above. Data includes top 9 largest strategies based on AUM in the eVestment Global Emerging Mkts Fixed Income – Hard Currency universe, with stated benchmark as either the JPM EMBI Global or the JPM EMBI Global Diversified Index. Note: Calculated with monthly returns dating back to January 2015.

3. Focused portfolio construction can drive potentially consistent outperformance

Robust portfolio construction is essential to transforming good ideas into portfolios that aim to meet clients' risk and return objectives, as well as constraints. Our process is focused on maximising risk-adjusted rather than total returns. We target the most attractive opportunities irrespective of credit rating.

To build a high-conviction portfolio, we are benchmark agnostic at the issuer level, which allows us to concentrate on countries that are meaningful from a risk/reward perspective at the total portfolio level. While the EMBI Global universe is defined by 70 countries, as at December 31, 2022, the portfolio will typically have exposure to only around two-thirds of that total, with 15-20 positions driving risk contributions at a portfolio level.

To strike the right balance between long-term and short-term opportunities, we break down the portfolio into core, active and tactical positions. This seeks to ensure capital is allocated to credits that offer improving prospects across a diversified universe with an appropriate blend of opportunities to maximise risk-adjusted returns.

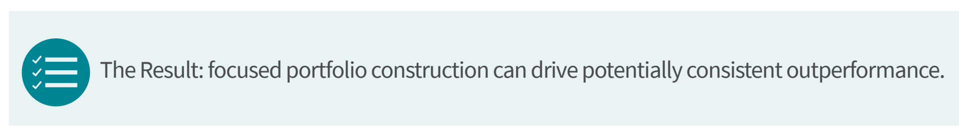


Figure 5. **Clear separation of credit beta and alpha drivers**

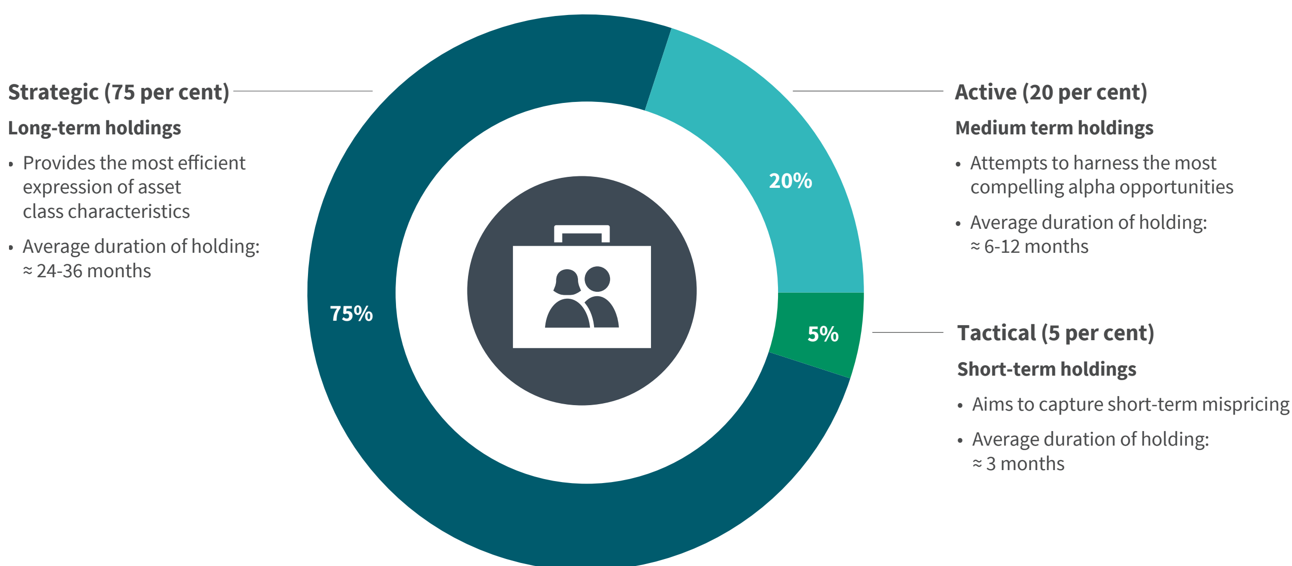

For illustrative purposes. Individual portfolios may vary due to market conditions and client-specific restrictions on specifications.

The result

To recap, we believe there are three main reasons many managers fail to outperform in periods of market weakness:

1. A structural bias towards the higher-yielding parts of the EMD market.
2. A poor understanding of EM-specific risk factors and overreliance on traditional risk metrics.
3. Deficiencies in portfolio construction that lead to concentrated portfolios and overreliance on credit spread compression.

By understanding and correcting for the biases and pitfalls, we believe we can deliver:

1. Alpha that is uncorrelated to spread differentials between high yield and investment grade.
2. Enhanced capital preservation and a smoother path of returns versus peers and the benchmark.
3. A differentiated process that can generate positive excess returns throughout market cycles without being overly reliant on a single source of alpha, such as credit beta.

We believe there are three main reasons many managers fail to outperform in periods of market weakness

Aviva Investors Global Services claims compliance with the Global Investment Performance Standards (GIPS®) and has prepared and presented this report in compliance with the GIPS Standards. Aviva Investors Global Services has been independently verified for the periods 1st January 1998 to 31st December 2023. The verification reports are available upon request. Verification assesses whether (1) the firm has complied with all the composite construction requirements of the GIPS standards on a firm-wide basis and (2) the firm's policies and procedures are designed to calculate and present performance in compliance with the GIPS standards. Verification does not ensure the accuracy of any specific composite presentation. The firm is defined as Aviva Investors Global Services, which includes all managed assets, excluding direct real estate investments. The firm was redefined as of 31 December 2013, when open ended direct real estate assets were removed from the firm. Closed end direct real estate assets had been excluded from the firm as at 31 December 2010. Therefore, direct real estate assets managed by Aviva are not included within the assets under management value. Following the acquisition of Friends Life group by the Aviva Group, the assets managed by Friends Life group, and it's investment operations, were integrated into Aviva Investors in 2015. Aviva Investors Global Services AUM increased from £131bn at the end of 2014 to £172bn at the end of 2015. Further details are available upon request. Further to an agreement dated 26 May 2018 between Aviva Investors Global Services Limited and LaSalle Investment

Management, Aviva Investor's global indirect real estate investment division was transferred to LaSalle Investment Management with effect from 6 November 2018. The aim of portfolios within this composite is to achieve capital growth or income by investing in bonds of issuers in worldwide emerging market countries. To achieve the investment objective, investments may be made in bonds issued by Governmental, quasi governmental and corporate issuers and in financial derivative instruments such as futures, options, swap contracts, swaptions, forward currency exchange contracts, foreign exchange OTC options and credit default swaps, each of which may be traded through recognised exchanges or via the over-the-counter market.

This composite was created on 02/07/2010. With a start date of 31/12/2003. Returns are presented gross of management fees and other expenses but net of all trading costs. For unitised funds, gross returns are calculated by adding back the Total Expense Ratio (TER) only, or part thereof, to the net return. Actual fees charged are dependent on the mandate and value of client assets. The fee scale for pooled clients ranges from 0.2% p.a. to 1.8% p.a. and for segregated mandates the fee scale starts at 0.5% p.a. All income is taken gross of tax, but net of irrecoverable taxes. Further information is available upon request.

Composite dispersion is calculated using the asset-weighted standard deviation of all portfolios that were included in the composite for the entire year. If the composite includes less than 5 portfolios for the full year no measure of dispersion is shown. Additional information regarding policies for valuing portfolios/funds, and calculating and reporting returns is available upon request. A list and description of all composites is available upon request. Three-year annualised ex post standard deviation measures for both the composite and benchmark are shown as Composite Risk and Benchmark Risk. This information is not presented when there are less than 36 monthly observations available. This composite is measured against the JPMorgan Emerging Markets Bond Index (EMBI) Global index which is a comprehensive emerging market debt benchmark that tracks returns for US dollar-denominated debt instruments issued by emerging market sovereign and quasisovereign entities.

Key risks

Investment Risk and Currency Risk

The value of an investment and any income from it can go down as well as up and can fluctuate in response to changes in currency exchange rates. Investors may not get back the original amount invested.

Emerging Markets Risk

Investments can be made in emerging markets. These markets may be volatile and carry higher risk than developed markets.

Credit Risk and Interest Rate Risk

Bond values are affected by changes in interest rates and the bond issuer's creditworthiness. Bonds that offer the potential for a higher income typically have a greater risk of default.

Derivatives Risk

Investments can be made in derivatives, which can be complex and highly volatile. Derivatives may not perform as expected, meaning significant losses may be incurred.

Illiquid Securities Risk

Some investments could be hard to value or to sell at a desired time, or at a price considered to be fair (especially in large quantities).As a result their prices can be volatile.

Sustainability Risk

The level of sustainability risk may fluctuate depending on which investment opportunities the Investment Manager identifies. This means that the strategy is exposed to Sustainability Risk which may impact the value of investments over the long term.
